numerous. Five years following only about 20 per cent. of the women voted, then a 1901 issue again brought out their full vote. In the small city a slightly larger per cent. voted, but the fluctuations were similar. In the country village from 60 to 90 per cent. of the registration always voted at regular elections: women candidates for local offices are rare. In one special school election, 168 men and 151 women voted. At the next one, six men and three women. So you see there is a wide variation. As to the influence of this vote, my opinion is that in the city it was nothing, except when some special issue, like Judge Ben Lindsey, was up, and then it turned the scales the right way. In the smaller city it made virtually no difference in the relative strength of the political parties, except in town and county officers, when scratching greatly increased. The same precisely, but in a greater degree, in the village. I think it is generally conceded that only on rare occasions does the female ballot affect results, but every nominating convention knows that vote is there and can be aroused, so they are careful. Women participate in the primaries and conventions to a slight extent only since the first few years. The ignorant women, like the ignorant men, are the most persistent voters everywhere. Has it occasioned friction, public or private? Never to my knowledge. Is female suffrage a success in Colorado? In a mild degree I would say it was—besides, some think it is right.

DR. J. TRACY MELVIN.

SANTA CRUZ, CAL.

Did Not Vote as Her Husband Did.

I have been a reader of THE INDEPENDENT for about twelve years, and have always admired the liberal policy of the paper. Every one is given fair treatment, black or white, rich or poor, man or woman. And now woman suffrage is to be given a hearing. I lived for twelve years in Colorado, where women had full right of the ballot. I voted for President three times. I did not vote as my husband did at any of the three elections, and our home was not broken up over it. We read the same papers, but arrived at different conclusions. We each read and thought for ourselves. All of the women I knew personally did the same. The women of the town of — always voted at the city election, and year after year kept out saloons. I never knew of a woman to sell her vote. If she had one for sale she would ask more than a drink of whisky or a smoke. A woman almost always served on the election board. And it was much nicer to go to the place to vote than to go to the postoffice for your mail. A woman who votes is just as womanly and feminine as a woman who does not vote. It is not a question of doubling the vote, or of a woman killing her husband's vote, or whether all women exercise the right to vote when it is given them. It is a matter of justice.

FRED BROWN.

SOUTH PASADENA, CAL.

Caught in a Trap.

For two years, while teaching in Trinidad, Col., I was registered and voted.

The second year I attended the primary. We met in the double parlors of one of the best residences. Our host was made chairman. He stated the importance of our meeting in selecting men for office who would be faithful to duty. He sat down and waited for some one to make a motion.

Stillness prevailed. Every now and then the chairman would suggest that some one make a motion; but there we sat in silence. I was forcibly reminded of the Baptist church meetings of my childhood, when the brethren sat in solemn silence twenty or thirty minutes between every motion that was made. Time passed that way at the primary. Finally I made a motion that the chairman appoint a nominating committee of not less than five nor more than seven, whose duty it should be to compare the merits of those who had announced themselves as candidates, and select a list for our consideration.

Instantly the motion was seconded and carried, and I found myself going out into the dining room with four men to make out the ticket. I sat at one end of the table with two men on my right and two on my left, and, beginning with mayor, we went thru the list, one by one. Each man took out of his vest pocket a list, and when the votes were handed in to me they were unanimous in their selection.

I understood at once that I had been caught in a trap. Those men on the committee and our host had held a caucus before coming to the primary and had agreed upon a ticket. The other men who were seeking office had no consideration whatever in our committee. When we reported our list it was unanimously adopted. I left the meeting under the impression that I was, perhaps, the only person present who knew nothing of a caucus, and that the long silence with which the meeting opened was for the purpose of getting a "tenderfoot" to make the very motion I had made.

MRS. B. N. JONES.

COLUMBIA, MO.

Wyoming's Testimony.

Last November I voted for the first time and for a President. Four years ago I was too young to vote, and I also lived in Nebraska. Early in the morning of Election Day I told Frank that I was afraid that I could not go to the polls. "Why not?" he asked, looking up from his fried eggs and bacon. "There's no one to take care of Roger." This was our six weeks old hopeful. "Put him in his go-cart and I'll push him down for you." When we came to the polling place, the County Court House, we could not well take the cart and pushing contents on the steps which lead to the voting place over the county jail. I wanted Frank to go and vote for me while I stood guard, but he said something about "After you, Alphonse," whatever that meant, and I went and voted first. I then stood guard and

he voted and went to work and I went home satisfied that I had helped save my country and the legislative ticket in which I was particularly interested, because I wanted certain things done for the University. I had been away from the cottage just fifteen minutes. Some way I felt a sense of contentment in me that I was able to express my desires thru the ballot box, and that the baby had not hindered me in this duty. This is what I think of "women's suffrage."

MARY DUNHAM.

LARAMIE, WYO.

Utah's Testimony.

When the suffrage first came into the hands of the women of our State there was (forgive me, susteren!) the usual spurt of enthusiasm. Our women's clubs were organized. Our wards were put in charge of chairmen. Our various committees were appointed, and we fell to! To what avail?

As nearly as I can see we accomplished the following stupendous results—I speak now of the organization, and have no reference to the six or eight hired emissaries of individual candidates who did some personal work, more or less telling.

Firstly: We maintained a club of perhaps fifty names, with an average attendance of ten or fifteen women at business meetings in a town of twenty-five thousand people.

Secondly: We served sandwiches, salad and coffee to the country friends who came in on Saturday shopping, and here the feminine instinct came out. It may have been hard to find committee women to distribute tickets and campaign literature; it may have needed some effort to get a motion put, before it was discussed; and it may have taxed the powers of the leaders to bring into comradeship natures naturally repellant at other times, for in politics you *dassn't* sift and winnow to find your friends; but when it came to serving refreshments, enthusiasm waxed greater with each succeeding Saturday, and with the increasing enthusiasm came daintier sandwiches, more astonishing salads, and cakes that were simply heavenly. Strange, too, as it may seem, when the fame of those luncheons spread, the city folks began to take notice, and before the end of the campaign a special tax had to be levied on the candidates to meet the grocer's bills.

Thirdly: We sat in state in the party carriages on registration and election days and dragged unwilling and uninterested women to the booths.

Fourthly: We sent a few of our shining lights to the settlements to organize the women and address the stalwart members of the party, "in our weak way and manner."

Fifthly: We elected to office an occasional woman who filled the position creditably, but the offices were invariably of minor importance and given simply to conciliate the women.

As to results, I am firmly convinced that they have been akin to the proverbial cipher with the rim rolled out aside from the fact that they have satisfied the cry for woman suffrage and have gratified the women now

ready for participation in public life, who are proportionately of one to one hundred. From practical experience—for I was one of the early enthusiasts—I feel safe in saying that the great majority of women in Ogden do not know when the various primaries are to be held, and the primaries are the very kernel of political welfare; they do not know who the prospective candidates are, and hence, if dragged out at the last moment by some interested one, cast their vote merely as a personal obligation to some friend, or to avenge some "hurt."

We are not able to point to any one law enacted for the betterment of the community, or the installing of any one clean officer as a result directly of the woman vote in our State. Some good laws have been past, and some good men have been elected, but the party machine has continued supreme, and the women have been little more than puppets in the hands of the bosses. The actual campaign work allowed women so far is minor and conciliatory, and hence uncomplimentary; the reward of equal unimportance.

FANNIE DAY HURST.

OGDEN, UTAH.

Organizing the Movement in Australia.

The history of woman's civic emancipation in Australia varied little in the different colonies, therefore our campaign in the mother colony may be taken as a composite picture of the struggles of the other five colonies in the many and disheartening difficulties and vicissitudes which beset our purpose.

We began an active campaign in the beginning of 1891, when some dozen or more friends met at the house of one of us, and decided to organize a franchise league. The first outline of the policy to be adhered to included two unwritten laws, which, in the light of suffraget policy today, had a wider influence than we ever realized.

The first was that in selecting our committee we should see to it that women of every class were upon it, and special pains were taken to include self-supporting widows and spinsters. For that is the class which most needs the moral support of the vote, apart from any question of "no taxation without representation." It proclaimed our purpose catholic, and brought to our meetings the starved, beaten wife of the drunken bully, the school teacher, the rich woman, removing from the league any suspicion of class or money.

The second unwritten law was equally hard and fast, tho it never had tangible expression. Bearing in mind the taunts thrown at Old World suffragists as the "Shrieking Sisterhood" and "Figures of Fun" from their profound contempt for mere personal appearance, we decided never to forget womanly dignity, whatever the provocation, and always to appear on public platforms as becomingly dressed as our circumstances would permit. Affectations of masculine fashions or anything bizarre were tacitly taboo. Many may think that such details are unworthy of consideration in a great cause. But there is much

gain to an unpopular party in giving no cause for offense in matters of detail, and we soon found our common sense deprived opponents of two fruitful sources of criticism.

How did we accomplish our great and bloodless victory? Only by such legitimate means as public and private meetings, petitions to Parliament, deputations to premiers, waiting on members of both houses, bombarding candidates with questions, making the issue a live one in electorates, and attending political meetings to ask legitimate questions politely. In one respect we had an advantage. The single tax and payment of members had brought numbers of laboring men into politics, and they, believing woman's emancipation would double their vote, gave willing support to the movement. For this reason principally the battle of woman's rights has been won comparatively quickly in Australasia, tho to the workers the moment of victory seemed a veritable will o' the wisp for years.

South Australia was the first country on the Island Continent to free women; that was in 1894. Western Australia followed in 1899; New South Wales in 1902; Tasmania in 1903, and Queensland in 1905, while Victoria hesitated until January of this year. The reason why the latter was so long in granting as a State right what its women had possessed as a Federal right since 1902 was the fear that the women's vote would double the vote of Labor, already too powerful for the expansion of the country. It is early to say whether this fear was well grounded or not; but the experience of New South Wales so far is a denial, for in two Labor constituencies of Sydney women showed an acuteness in sifting political questions when a reform movement was before the country which completely defeated the Labor candidates in favor of the reformers. There is nothing to be astonished at in this attitude, for woman is as essentially conservative as man is constructive and destructive; and her natural bias is likely to be a useful factor in law making, especially in countries so devoted to experimental legislation as Australasia.

The result of woman's emancipation has proved again that only the unexpected happens. Instead of domestic quarrels, and a slackening of respect for the weaker sex, it has brought increased respect, and if there have been differences of opinion, husbands and wives have kept their own counsel, for the public knows nothing of them; if there have been bribes, the secret has been equally well kept. But the laws with regard to elections are so strict that bribery plays little part in the game of politics. Women may sit in Parliament, but having tested the validity at first elections, they are content to be represented by men, and devote their political energies to that domestic legislation which men are apt to put aside for a more convenient opportunity, leaving the larger issues of defense, taxation, land and irrigation laws, and expansion to the beams most concerned with such subjects. Thus in the seven years of civic freedom the women of New South Wales have seen to it that the following laws were past: Local Option, Juvenile

Courts, Infants' Protection Act, Criminal Amendment Act, Juvenile Smoking Bill, Women Inspectors of Factories, Police Matrons for most of the Jails in the State, Seats for Shop Girls, partial enforcement of the Inebriate Act, and a Woman's Naturalization Bill.

Australasia heeded the cry "Trust your women," and she does not regret it.

MISS M. L. MANNING.

NEW YORK CITY.

The Experience of the Antipodes.

I venture to hope that the testimony of one who lived nearly twelve years in Australasia (the home of female suffrage), and who was a candidate for the Commonwealth Parliament on the occasion when women first had the privilege of the Federal franchise, may not be without interest to your readers on the present occasion.

(1) As one who has seen the actual working of the principle, I am entirely convinced that

tific method to the political campaign by *requesting* three or more candidates for parliamentary honors to address them once a week during the same evening. The consequence was that different views were aired on the same platform, and the "comparative method"—which is the one scientific method—was (so far as I know) for the first time introduced into political life. I need hardly add that the "request" of this body of electors operated as a very emphatic mandate on all candidates. (3) Female suffrage enormously increases the power of the "married" or "family" vote. In nine cases out of ten a man, his wife and adult daughters will vote the same way. The result of this is that the voting power of the "paterfamilias" is at least doubled. This is an almost incalculable advantage, because the married man, having "given hostages to fortune," is the most permanent element in the community, and anything which strengthens his influence is a direct and important political gain.

In conclusion I may observe that a very

LONDON SUFFRAGETTES IN PRISON GARD

London Suffragettes line up in front of their demonstration which took place outside the House of Commons to protest against the Government's refusal to treat the object suffragettes as political prisoners.

in political life the advent of the woman voter is exercising a purifying, an elevating and an ennobling influence. There is, in my opinion, as a direct result, less bribery, and a greater desire to choose the best man. (2) In Tasmania, where I lived, the Women's Franchise Amendment Amendment is true and a more sci-

striking tribute to the patriotic influence of female suffrage has lately been afforded by New Zealand. New Zealand was the first of the Australian colonies to give the vote to women, and she has (to the everlasting shame of the Dominion of Canada and the Commonwealth of Australia) been the first to offer

a Dreadnought to the mother country at the first whisper of need. It is, in my opinion, a mistake to claim votes for women on the ground of equality. It is rather because woman is complementary to man (as man is complementary to woman) that the combination of the two is desirable not less in political than domestic life. The State is, after all, merely the family represented on a larger scale. The idea that the exercise of the suffrage "defeminizes the enfranchised voters" is—as any Australian will tell you—the sheerest nonsense. At the same time I must own I deeply deplore the vagaries of the English suffraget.

(Prof.) R. E. MACNAGHTEN.

MCGILL UNIVERSITY.

Equal Suffrage in Australia.

Till four years ago I had lived all my life in Australia and knew the suffrage movement from its very beginning till its first considerable success, when the South Australian women were enfranchised in 1894, till the Federal franchise was granted to all Australian women in 1902. Results: First, educative; second, legislative, as seen in the increased attention given to laws which guard the home, motherhood and childhood. South Australia, which earliest of the Australian States enfranchised its women, was the first country in the world to have a legally constituted juvenile court (1896). It has still the most complete system of caring for the neglected or delinquent child. It brings home responsibility to both parents of an illegitimate child by collecting expenses of confinement and maintenance from the father before birth, thereby preventing many cases of infanticide, and assists the mother afterward by keeping the eye of official inspection over the home and surroundings in which she has her baby boarded out, thereby lowering by half the death rate among such infants.

ALICE HENRY.

CHICAGO, ILL.

Woman's Suffrage in Bohemia.

It is quite remarkable that in the country of Bohemia women have had equal rights with men since the year 1861. This does not mean that Bohemia has had equal universal suffrage since that time, for it has not. Only persons over twenty-four years of age, who pay property or income taxes, and professional people have been allowed to vote. But the law makes no discriminations as to sex. To be sure, not all women who have had this right have used it all these years. But within the last few years the women of Bohemia have been very actively working to secure universal suffrage for women. It has been my privilege to meet the leaders of this movement during my year's visit in Prague, and I can say candidly that they are as feminine as women can be, and have lost not an iota of tenderness with which nature endowed them. They are intelligent, sympathetic and ladylike. Most of them are teachers, unmarried.

JOSEPHINE F. SISKOVSKY.

PRAGUE, BOHEMIA.

New Zealand's Good Work.

I have been five times in New Zealand, the first country to grant women votes for a national legislature.

In 1890 the islands were on the verge of bankruptcy, men were leaving the country for want of land and work, and monopoly, corruption, privilege and poverty were assuming ever more alarming proportions. In September, 1893, the ballot was granted to the women, and I was present at the first election in November.

Every prophecy of evil, the same that are made in the United States now, was falsified, the best men, regardless of party, were elected, and never had even New Zealand conducted a more decorous campaign. No charges of corruption have ever been brought against the women, and the husbands and wives go together to the polls, discussing the different candidates. Groups of women take turns in minding each other's babies outside the booths. Instead of causing family jars, equal suffrage has given the family a common topic of interest and conversation, and it has greatly added to the respect of boys for their mothers and women in general. Where formerly the women gossiped, while the men listened with half-concealed contempt, the whole family now discusses intelligently the latest political events.

There are no neglected homes or deserted children, or children who toil in factories or stores, now, in this, the pioneer land of suffrage, and there are no men prouder of their women, as wives, mothers, and excellent managers and housekeepers, than the men of New Zealand. In the ten years from 1893 to 1903 the women obtained these laws: Testator's family maintenance act, infants' life protection act, admission of women to the bar, amendments to the industrial school act, slander of women act, legal separation without expense, servants' registry offices act, wives given municipal votes in virtue of their husband's qualifications, technical schools established, factory acts, regulating the wages, health and interests of female employees; act to raise the age of consent, the old age pensions act.

Three years ago the Premier of New Zealand said: "There is today not a pauper in New Zealand"; and he clearly and distinctly gave the credit for this fact, and the general prosperity of the richest per capita country, to the women voters.

JENNY C. LAW HARDY.

TECUMSEH, MICH.

Woman Suffrage in Western Canada.

For four years I have been in touch with the best women living on farms all over Western Canada, and as this country is almost entirely agricultural, these women voice the general sentiment of Canada West. Feminine franchise privileges at present are limited. In Manitoba the municipal franchise is extended to any woman rate payer, but in Alberta, Saskatchewan and British Columbia only to widows and spinsters. Exceptions are found in Calgary and Edmonton, where married women owning property have a vote in municipal

affairs, and in Victoria, where all women over twenty-one have. In all of these four provinces every woman rate payer has the school franchise, and can be a candidate for trustee. The general feeling among Western women (largely American, Canadian and English) is not one of indifference to and ignorance of public affairs, but there is no clamor for the suffrage. They seem to prefer their privileges to their rights. FLORENCE LEDIARD.

WINNIPEG, MAN.

Women's Suffrage in England.

Amid the hurly-burly of the woman's suffrage agitation in England it is sometimes forgotten that woman's suffrage there in all departments of local government is now quite beyond the experimental stage. The woman householder in England, wherever she may live, has a vote for a representative on either two or three local governing bodies. These governing bodies are the county council, the board of guardians for the relief of the poor, and the council—borough, urban district, or parish council, according to locality—which governs the city, town or village in which she resides. In the larger or county boroughs, the county and borough councils are amalgamated and form but one body. On all these councils also, women are competent to sit as representatives; and not only is the experimental stage passed as regards woman's suffrage in these local affairs, but no one now denies the usefulness and beneficence of the presence of women on such bodies as the poor law boards of guardians, the parish and district councils or the education committees which control the public elementary schools. To the borough councils women were only admitted in 1907, and consequently their service on them can hardly be spoken of as proven by long experience. Only the Guildhall of the City of London, where the ancient and unreformed aldermen and councillors meet under the presidency of the successor of Dick Whittington, are women now forbidden to enter, a prohibition of little account, as practically no women are within the boundaries of the City.

It is not easy to obtain the figures in regard to the number of women who have been elected to serve on local governing bodies in England. About nine hundred poor law guardians are women, and with the addition of women serving on parish, urban district, and

borough councils, a conservative estimate would bring up the number of women who have been elected by the popular vote—male and female—to 2,000. The Anti-Suffragists in England—organized and unorganized—have gone on record as approving these forms of political activity for women, and they cite the fact that women have succeeded so well in these spheres, not as a proof of their fitness for the parliamentary suffrage, but as an evidence that there is ample work for them to do without endeavoring to increase their powers.

ANNIE G. PORRITT.

HARTFORD, CONN.

A Sacred Duty.

Why should women be excused from bearing a few of the burdens and some of the responsibilities of government? Why were they ever excused from it? If, because they were frail creatures, that has gone out of style. There are so many duties in life that we would all rather not perform, but that is not really a logical reason why we should shirk them.

Since "coming of age" I have voted on some questions, somewhere, at every election, excepting one year when we were in Alaska.

As our home is built on a foundation of equal suffrage, love and loyalty, it is not likely to suffer from outside influence. There are hosts of such homes. My own belief is that the more husbands and wives work together in matters of public interest the stronger the home ties become and the more they appreciate, love and cling to their own fireside. It is a sacrifice to give time to public affairs.

It is also a sacred duty to many. I cannot say that I think women have as yet largely improved politics, but with the Government in the condition it is at present it is high time they exerted their influence and exercised the mind back of it.

In Colorado we are thinking as never before, and we know that it is a grievous mistake to wait until campaign time to begin to think.

The greatest good that women will accomplish in the near future will be to help control child labor and child idleness. We shall only help because this problem is, as are all others we strive for, just as important to fathers as to mothers.

GERTRUDE BILLEN HOLLISTER.

President Colorado Federation
Women's Clubs.

DENVER, COL.

Germany—The Main Obstacle to the World's Peace

BY AMOS S. HERSHEY, Ph.D.

[The author of the following highly significant, not to say sensational, article is Professor of Political Science and International Law in the University of Indiana and is one of the authorities on international politics in America. His volume, "The International Law and Diplomacy of the Russo-Japanese War," has received the highest praise and he now has in press "Roman Diplomacy and Imperialism." He spent two months in the summer of 1907 at The Hague studying the proceedings of the Second Hague Conference. He wishes it distinctly understood that he has nothing but the highest respect and even admiration for the great German race, whose blood he carries in his veins and at one of whose great universities he has received an important part of his training. Editor.]

IT will scarcely be denied by real students of contemporary international politics that Germany is the greatest obstacle to the world's peace today. This fact has become even more strikingly evident since the recent debate in the British Parliament.

Americans, who have lived thru a series of Japanese war-scares, may be disposed to take the Anglo-German "naval scare" lightly; but a little reflection should convince even the pacifists that the English are neither "silly" nor "foolish" in exhibiting alarm over the present situation.

The two cases are dissimilar both as to causes and probable consequences. In the Japanese question we were (and still are) confronted with conditions of irritation of very recent origin which might in time develop serious symptoms, if sufficiently stimulated by the yellow newspapers of both countries. But we are bound to Japan by the closest ties which can exist between nations, and ex-Secretary Root has assured us that "never for a moment was there, as between the Government of the United States and the Government of Japan, the slightest departure from perfect good temper, mutual confidence, and kindly consideration." Besides, the notes exchanged between Secretary Root and Ambassador Takahira, on November 30th, 1908, in which both Governments agree to respect each other's territorial possessions in the Pacific, should put an end to any further possible anxiety on our part.

On the other hand, the relations between the English and Germans have

been strained for more than a decade. It is not ours to apportion the blame, we have but to note the fact. The famous Krüger telegram of 1896, intense commercial rivalry, the hostile attitude of the German people during the Boer War, the mad imperialism of the German Emperor and his entourage, the venomous abuse and criticism of the press of both countries, and, finally, the manifest intention of Germany, but recently fully realized, to wrest from Great Britain her maritime supremacy—all have combined to create a situation of extreme gravity. To England, maritime supremacy is a matter of life and death; to Germany, it is an object of mere desire or ambition.

Examples of German aggressiveness have been multiplying within recent years. The first American experience of it was in the far away Samoan Islands in 1888, and a second in 1898 when Germany dispatched a powerful fleet to the Philippine Islands and the aggressive conduct of its Admiral caused alarm and indignation in the United States.

Japan experienced it in 1895 when Germany joined Russia and France in forcing her to re-cede the Liao-tung Peninsula. The piratical seizure of Kiao-chau from China early in 1898 on the pretext of indemnity for the murder of two German priests furnished a pretext for the taking of Port Arthur by Russia the same year and ultimately contributed in no small degree to the outbreak of the Russo-Japanese War. The harsh and relentless attitude of the German Emperor during the Boxer uprising and the peace negotiations which followed created an extremely unfavorable

impression in Europe as well as in America. It is generally known that Germany took the initiative in the blockade of the Venezuelan ports in 1902.

Since the power of Russia has been greatly lessened as one of the results of the Russo-Japanese conflict, the German Government seems to have become even more aggressive. The resignation in 1905 of M. Delcassé, the French Minister of Foreign Affairs and author of the Anglo-French *entente*, due, it is believed, to the intrigues of Germany; the German intervention against French activity in Morocco which led to the Algeciras Conference of 1906; and the recent mobilization of the German army on her eastern frontier for the purpose of forcing Russia to recognize forthwith the annexation of Bosnia and Herzegovina by Austria—are examples of German aggressiveness within the past few years.

Actions speak louder than words, but if verbal evidence be needed to show that the "German Peril" is no mere figment of a disordered imagination, it may be found in the "Kaiser's Speeches" as translated by Mr. Wolf von Schierbrand, and a volume entitled "German Ambitions," published in Putnam's "Questions of the Day" series in 1903.

Von Schierbrand shows that up to 1895, the date of the opening of the Baltic Canal, the Emperor's speeches were pacific in tone and that his activities were directed toward the maintenance of peace. On August 5th, 1888, within two months after his accession, he said in response to a toast proposed by the Prince of Wales:

Germany possesses an army which appears adequate for her needs, and while the British nation owns a fleet commensurate to their requirements Europe in general will look upon this fact as a most potent factor in the preservation of peace."

In 1891 he said at the Guildhall banquet given to the Lord Mayor of London:

"My aim, above all, is the preservation of peace; for peace alone can inspire us with the sentimentality for the universal development of science, commerce and art."

On January 30, there came the famous Kruger telegram in the occasion of the Transvaal crisis, which was followed, as might have been expected, by a perfect

storm of abuse and criticism in the English press. After that untoward event, the Emperor's tone changed completely.

In June, 1897, he said in a speech at Cologne:

"We have great duties in the world. There are Germans everywhere whom we must protect. German prestige must be preserved abroad. *The trident belongs in our hands.*"

In 1900, upon delegating to Prince Henry the command of the Oriental fleet:

"Imperial power is sea power. The two are mutually dependent . . . Should any one infringe our rights, then use the *mailed fist* and earn your laurel wreath."

Again, on the occasion of the baptism of the "Wittelsbach," on July 4th, 1900:

"The sea and sea power are indispensable for Germany's greatness. But it is the sea, too, which proves that neither upon the water nor upon the land, in far away countries, decisions must be reached or events happen without the consent of Germany and the German Emperor."

His speeches to his departing soldiers during this exciting period contain such expressions as these: "Spare nobody." "Take no prisoners." "Give no quarter."

It should be remembered that the Kaiser's speeches are not the mere vapors of an effervescent mind—an erroneous impression all too common—but that they were accompanied by acts which show that they represent the deliberate and well-matured policy of one of the most remarkable men of all time.

That Germany is the greatest obstacle to peace thru obligatory arbitration and a limitation of armaments is shown by her attitude at the two Hague Peace Conferences.

At the Conference of 1899 Germany led the opposition to Russia's proposals for limited obligatory arbitration and a limitation of military and naval expenditure; and it was only with the greatest difficulty that the German Government was persuaded to consent to the establishment of the so-called permanent Court of Arbitration.

At the Conference of 1907 Germany favored obligatory arbitration in *principle*, and supported the American project for a Court of Arbitral Justice or Supreme Court of the Nations, as also the Porter resolution designed to prevent the use of armed force in the col-

lection of contract debts; but her attitude was reactionary in almost every other respect. She held, in general, strict views of belligerent rights; opposed effective regulation of the laying of submarine mines; voted against every specific proposal in favor of obligatory arbitration; and would not even permit the insertion of the words "more urgent than ever" proposed by Great Britain, in the resolution adopted by the Conference on the subject of limitations of arbitration.

The German Government has itself virtually admitted that it has rejected the advances since made by the British Government to enter upon an Anglo-German understanding concerning the cost and extent of their naval programs; and excuses itself on the ground that no *formal* proposal had been made which might have served as a basis for official negotiations. It is evident that a formal proposal from Great Britain could only follow a sympathetic response to her first overtures.

How is the reactionary attitude and aggressive conduct of Germany during recent years to be explained? It appears to be due in part to the temper of the German Emperor, the autocratic methods of the German Government, the military and naval discipline of the German youth, and the teachings of German historians, economists and philosophers. But these are, in turn, the results of historic traditions and economic forces.

It should not be forgotten that the birth-pangs of the modern German Empire were accomplished at Sadowa and Sedan. Then did Germania issue forth a full-grown, united warrior-nation born in the midst of smoke and battle—product of Bismarck's policy of "blood and iron." She has been nurtured in the midst of an armed camp on smokeless powder, rapid-firing guns, and patriotic speeches by her "War Lord."

Wedged in for a generation between France and Russia, who both had reason to fear and hate her, this nation of warriors has compelled others as well as herself to bear military burdens beyond a parallel in history. Feeling the needs of expansion, felt by every growing and prosperous nation, she has found herself checked and thwarted in her commercial

and colonial aims by England, the mistress of the seas. Relieved for a season by the paralysis of Russia from the pressure upon her Eastern frontier, Germany has become a menace to Europe, from which partial relief has been secured by British diplomacy thru a network of alliances between Great Britain, France, Russia and Japan. Except for her alliance with Austria-Hungary, Germany now feels practically isolated in Europe, but is determined to break the "iron ring" with which she imagines herself encompassed. She feels that to be requested to reduce or even to limit her ever-increasing armaments would be like asking a soldier to throw away his weapons when he is surrounded by enemies.

Soon after his accession in 1888, Emperor William II, an expert in naval matters, entered upon a campaign in favor of a strong navy—a herculean struggle in which he has displayed marvelous knowledge, exhaustless energy and remarkable patience—a quality for which he fails to receive due credit because of his impulsive temperament. After years of strenuous labor, he has apparently converted the German people to his views upon this question, for since 1898, the German Reichstag has sanctioned naval programs¹ which provide for battleships and cruisers of constantly increasing size and in accelerated numbers. According to a statement made by Sir Edward Grey, Germany will have thirty-three Dreadnoughts when her present program is completed—"the most powerful fleet the world has ever seen."

The preamble of the German Navy Bill of 1900 plainly states the purpose of the measure:

"Germany must have a fleet of such strength that a war against the mightiest sea power would involve risks threatening the supremacy of that power."

Two facts of world-wide importance stand out clear and unchallenged as the result of the recent naval debate in the House of Commons. One is that while

¹The naval bill of 1900 provided something like 38 first class battleships, about the same number and size as a hundred torpedo boats, twenty or thirty smaller destroyers. It was generally assumed that these were to be completed by 1905, but there is nothing to prevent the Government from anticipating this "peace" program. The law also provides that submarines are to be laid down, the all-out cost of the construction of the vessels, the cost of equipping and the program is estimated by H. W. Wilson at \$400,000,000.

Great Britain has been actually reducing the expenses of her military and naval establishments," Germany has anticipated a part of her "paper" program. The other is that Germany has also been increasing her facilities for the building of Dreadnoughts at such a tremendous rate that she is now able to compete with Great Britain on practically equal terms. And she has apparently accomplished these results without the slightest knowledge or remotest suspicion on the part of the British Government.

It was pointed out that Germany laid down nine Dreadnoughts in one year, and that she has today no less than fourteen slips for building these gigantic battleships with three more under construction. Some consolation may perhaps be derived from the fact that at the present rate of building, it takes at least twenty-six months to complete one of these monsters, which means that neither Germany nor Great Britain can possibly build more than eight per annum. True it is that some of these facts have been officially denied at Berlin; but those cognizant of the Machiavellian principles (*Realpolitik*) which are practised by the German Government since Bismarck's day will give little faith and credence to such denials.

There are other evidences of German activity. The *Kölnische Zeitung*, reports that 40,000,000 marks (nearly \$10,000,000) have been voted by the German Reichstag for the improvement of Heligoland during the present year. Of this amount 37,500,000 marks is to be expended on the construction of a port for torpedo and dispatch boats. Mr. Arthur Lee is responsible for the statement that Messrs. Krupp, the great gun-making firm at Essen, had increased the number of their employees by thirty-eight thousand men during the past year. Account should also be taken of the fact that Austria-Hungary has begun the construction of four new Dreadnoughts.

The situation thus outlined is not without interest to the United States. There is now visible on the horizon a foreign fleet other than British greatly superior to our own. As suggested by Captain Mahan in a recent article published in *Collier's Weekly* for April 24th, Germany may not have the intention, but she will have it in her power to disregard the Monroe Doctrine. Only naval force can control the issue.

There is no use in blinking or evading these facts. The German opinion of that "dog-in-the-manger" policy known as the Monroe Doctrine is well known to the American people, and Germany will hardly hesitate to ignore it if she finds it expedient to do so. The German Emperor believes that he has the right to intervene for the protection and advancement of German interests in all parts of the world, and the German interests in South America are by no means a minus quantity.

Aside from the peril to the Monroe Doctrine involved in the mere existence of a powerful German navy, the people of the United States could hardly remain neutral in a war between Germany and Great Britain which might possibly end in German naval supremacy.

The whole world shares in the benefits of free trade with Great Britain; and since her abandonment of extreme theories of belligerent rights, neutral commerce flourishes under the protection of the British flag even in time of war. Could we reasonably expect the same degree of security and prosperity with the trident in the hands of Germania?

Even a blow at England would be felt as a severe shock in the United States. A blockade of the British Isles by German cruisers and submarine mines, or the loss involved in the danger to contraband trade would be severely felt in this country. During the year ending June 30th, 1907, nearly one-third of our total exports went to the United Kingdom and nearly one-half to various points in the British Empire.*

What is the remedy for this menace to the World's Peace? What policy should we pursue under these circum-

*In 1906, \$814,000,000. All this amount \$281,255 went to the United Kingdom. The total exports of the United States in that year were \$3,140,000,000. For general information worth of merchandise were imported into the United States from Great Britain and Ireland.

stances? These are vital questions which greatly concern the people and Government of the United States. There is no immediate danger of war, for Germany's Dreadnoughts will not be ready before the year 1911 at the earliest. We have, therefore, plenty of time for deliberation and discussion. It seems to me that there is but one alternative. All talk about a limitation of armaments at this time is vain, for Germany refuses to listen. We may deny the facts, but that simply shows that we have eyes to see, and see not. To charge the belligerents with madness, or to accuse England of having built the first Dreadnought does not mend matters. Either we must follow Captain Mahan's advice and enter into this deadly competition of armaments, or conclude a defensive alliance with Great Britain. Alliance or armament: that seems to be the only practical alternative.

The way for such an alliance has fortunately been prepared within recent years. It is but fourteen years since the American people were roused to a frenzy of patriotic fervor by President Cleveland's startling message of December, 1895, threatening England with war unless she consented to submit a boundary dispute between herself and Venezuela to arbitration. It then seemed as if the spirit of hatred and suspicion against England transmitted to us by our forefathers would never die out. This spirit had been kept alive after the wars of the Revolution and of 1812 by a variety of real and imaginary grievances, including trade rivalries and boundary disputes, and it was again renewed after the Civil War as a result, among other things, of the "Alabama" and Behring Sea controversies.

But a great change for the better has taken place between the two greatest branches of the Anglo-Saxon race, or, rather, between the parent trunk and its largest branch. There now exists a genuine friendship, based upon mutual sympathies and interests, between the people of England and those of the United States. There is a growing conviction in both countries, not merely that each Power will, in the future, refrain from attempting to injure the vital interests of the other; but that neither would

permit serious harm to the other at the hands of a third Power, and that both will try to work in friendly rivalry at the solution of the great problems set by modern civilization. One of these problems is the maintenance of peace. It may, indeed, be said that peace is one of the greatest interests of both countries, and that Great Britain and the United States are essentially Peace Powers.

The friendship which is felt for England in the United States today had its main source in the friendly and sympathetic attitude of the British during the Spanish-American War. During that war it apparently dawned upon our people for the first time that, among European peoples, the English alone had any real sympathy with, or even understanding of, our actual aims and motives in undertaking to drive the Spaniards out of Cuba.

The acquisition of the Philippine Islands in 1898 gave us a definite foothold and greatly increased our interests in the Orient, and imposed upon us some of the burdens and responsibilities of an Asiatic Power. In the solution of these problems, we have had the sympathy and moral support of England. Our interests in the Far East are practically identical, and both countries have worked in harmony with Japan to maintain the "open door" and integrity of China.

To those who urge Washington's advice against entangling alliances it may be replied that their warning comes too late. Whether for weal or woe, we have already abandoned that policy and assumed the responsibilities as well as reaped the advantages of a World Power. We crossed that Rubicon when we took possession of the Philippine Islands. At the West African and Algeiras Conferences we have even assisted in the solution of what have generally been regarded as purely European political problems.

To our German and Irish citizens who, it might be feared, would object to an alliance with Great Britain, from motives of hatred and a desire for revenge, we would point out that such motives are unworthy of them. Besides, international relations should not be determined by considerations of sentiment and passion; they should rest upon the solid

bases of mutual interest, common aims, and a real comprehension of motives. This foundation for a closer union exists between the people of Great Britain and the United States.

The advantages of such an alliance are obvious. We would obtain the aid of the powerful British fleet in case the Monroe Doctrine or American interests in the Pacific were endangered, and we would assist Great Britain in defending her naval supremacy, if attacked by any European Power.

Only by some such arrangement shall we be able adequately to protect our interests against all comers without the expense and labor of constructing and maintaining a navy equal or superior to that which Germany is now building. We should also insure the peace of the world for an indefinite period, and probably check this fatal competition in naval armaments which, if continued, must ultimately end in universal bankruptcy.

But it may be asked, what about the Hague Conferences? The present situa-

tion is one which no Hague Conference or series of Hague Conferences can control. Hague Conferences are supremely important and valuable. They may prepare the way for the only true ultimate solution of these and many other problems—the organization of the world on a Federal basis, of which the alternative is a continuation of the present "Struggle of the Nations" which must end in the survival of the fittest, i. e., the strongest, the best organized, and the most unscrupulous.

But the immediate problem is to curb and check the aggressive spirit of martial Germany, and secure peace for at least a generation. To that end we must add to the existing alliances and understandings between Great Britain and France, Russia and Japan a defensive alliance between the British Empire and the United States. As the London *Spectator* of January 2d, 1909, well observes:

"Probably the most potent of all the influences that are working for peace just now may be said to be the system of alliances which prevails in Europe."

Bay Days

BY JORDAN HERBERT STABLER

HAVE you felt the bay breeze blowing,
Seen the white clouds flying fast,
When the canvasback is winging,
And the wild geese hurry past,
And the skip-jack's heeling under,
On a course that's pointed South,
And you're headed, hale and hearty,
For the Chesapeake's stormy mouth?

And you race the oyster dredgers,
As they hurry to their ground,
And you pass the heavy bug-eyes,
To their gunwales laden down,
And the liner, ploughing northwards,
Leaves a furrow far a-stern,
And the wash comes rolling over,
And you take it in your turn.

Then the night falls, creeping slowly,
And the lights from off shore flash,
And the buoy sounds its warning,
As you racing onward dash
Past creeks, inlets and headlands,
Where the pale moon throws its gleam,
While the silence is only broken
By the swish along its beam.

And the spell that's all the Chesapeake's
Fills your soul and holds it fast,
And you dream of nothing better,
And you hope it's going to last,
And you feel your heart fast beating
With the spirit of the South,
As you're headed, hale and hearty,
For the Chesapeake's stormy mouth.

Men We Are Watching

BY A WASHINGTON JOURNALIST

Three of the New Senators

IT is true that, with the ending of the Sixtieth Congress, the United States Senate lost some of its best material; but the Sixty-first Congress finds it with several recruits far above the average in ability and promise, making for a decided gain, on the whole.

Very strong among the new men is Theodore E. Burton, of Ohio. He came over from the House of Representatives, where he began his national career in 1888. Excepting four years of recreation, he has served there ever since. He was chairman of the Committee on Rivers and Harbors for eleven years, and in that capacity he is best known to the country at large. In return it is fair to claim that Senator Burton probably knows more about river and harbor possibilities and necessities, in the United States, than any two men anywhere. But he did it because it was the work allotted to him, and because he is so constituted that it would be as impossible for him to do anything and not do it thoroly and well as it would for a bird to make a bungling job of flying. His specialty lies in another direction. Senator Burton is a natural student—one of the profoundest students in Congress. He graduated from Oberlin College when he was only twenty, and was admitted to the Bar at twenty-three. He is tall, stalwart, grave; the personification of dignity and always intensely serious. His lines of thought are like the man. His favorite

field of adventure is finance in all its phases. His book on "Financial Crises and Periods of Industrial and Commercial Depression" is standard authority, and his biography of John Sherman, in the second series of "Lives of American Statesmen," is a good illustration not only of his grasp of the subject but of his ability to approach it gracefully. He was a strong factor in the House Committee on Banking and Currency. He has decided notions on tariff matters—indeed he was McKinley's chief assistant when the McKinley tariff was constructed—but observing the custom of quiet for new members, he has taken little part in the present deliberations. When the currency bill comes up next session, however, those who know Senator Burton expect to hear from him. Advocates of a great waterway system for America are also looking anxiously toward Burton, who has been elected chairman of the Joint Congressional Commission on National Waterways. It is one of the most important questions devolving upon the present in preparation for the future and Senator Burton is distinctly the man for the place.

He is fifty-eight years old, tho few show less the marks of time. His hair is thinning on the top, but is still brown. His forehead is a fine dome for machinery of thought and in every line his face is the face of a deep thinker; but he is not lacking in democratic cordiality. In

SENATOR THEODORE E. BURTON.

fact—and in spite of all that has been said to the contrary—Senator Burton is among those who are easy to reach, if approached in the right way, and exceptionally pleasant to meet. He has a clear, strong voice, but he speaks slowly, concisely and earnestly. In several official positions he has stood boldly for international peace, and correspondingly against undue expenditure for naval armament. He delivered the principal speech at the Chicago convention, placing President Taft's name in nomination. His career in the Senate will be well worth watching.

Albert Baird Cummins.

From his strenuous life in the breezy West, Governor Cummins, author of the "Iowa Idea," blew into the Senate, and people wondered. Some turned up their collars and cringed. By a strong, courageous individuality he had accomplished great things in his home State, along vigorous lines of reform. He had won his way to Washington on the strength of them and his coming caused some un-

casiness—for reformers had been known to come out of the West bringing cyclones along with them.

Cummins came. A medium sized man, tending to be thin. A strong, kind face, with a cordial smile, a mass of long, gray hair, clear, earnest eyes, and quiet, democratic ways which instantly made friends for him. He has about him certain suggestions that he might become a cyclone, on occasions, and instantly impresses one as possessing a ready reserve of potential energy; but he assumed the toga with unusual appreciation of its responsibilities and has already made important strides toward a position of power and influence among his colleagues. He has already occupied the floor of the Senate on several occasions, commanding good attention. He is calm and deliberate on his feet, quick and keen in thought, but rather slow of speech and altogether lacking the furious energy which easily wrecks an effort in that sedate chamber. He is clear and logical in his conclusions

SENATOR ALBERT B. CUMMINS.

and has already won the approval of some whose co-operation is essential to successful legislative efforts.

Cummins is fifty-nine. He has been a prominent civil engineer, with a career before him as a great railroad constructor. He is a lawyer with a record of victories to be proud of. He is a politician who fought his way to the Governor's chair by his own might. The story of his life reads so much like romance that it has been told and retold till every one knows it; but until they meet the new Senator they cannot appreciate what a thoroly sincere and earnest man he is. After that they do not wonder at the unprecedented majorities by which he was three times made Governor of the State, before being sent to the Senate. Until he gains new laurels he rests with very honest pride on the results of his last term as Governor—the passage of the State-wide primary bill, and anti-pass bill, a bill prohibiting corporations from contributing to campaign funds, a 2-cent fare bill, and other legislation along the same lines. He is on the Senate Committee on Interstate Commerce, where he has an excellent opportunity to exert his influence for his favorite theories, and those who know him best are watching expectantly.

George E. Chamberlain.

Another Governor came from still farther West—George E. Chamberlain, of Oregon—replacing Senator Fulton. It is a curious combination. Oregon is an intensely Republican State. Chamberlain is strictly a Democrat. He calls himself "Just naturally a Democrat," having been born on a plantation, near Natchez, Miss., seven years before the war, and received his college and law education at the Washington and Lee University, in Virginia. In 1876 he went to Oregon and taught school till he was able to begin practising law. He served in the State Legislature and had held several official positions when, in 1891, he was appointed Attorney-General for the State. In 1900 McKinley carried Oregon by over thirteen thousand, but in 1902 Chamberlain was nominated for Governor and elected. In 1904 Roosevelt carried the State by nearly forty-

three thousand, but in 1906 Chamberlain was re-elected Governor by a substantial majority. Two years later, in the primaries, the people directed the Republican Legislature to elect their pet Democrat to the United States Senate. So Chamberlain came—just naturally a Democrat—elected by a Republican Legislature, to represent a bone and sinew Republican State, and every one watched to see what manner of man appeared. Even those who were forewarned were most agreeably disappointed. When they met him

SENATOR GEORGE E. CHAMBERLAIN

they realized the personality which had captivated Oregon. Senator Chamberlain is an ideal gentleman. He is well built, with a fine head covered with dark hair touched with gray. His high forehead gives one immediate impression of the intellectual power, but the eyes, the voice, the quiet good nature captivate instantly. A smile, a friendly word, a cordial hand-clasp are always ready to meet one more than half way. They are working wonders for Senator Chamberlain in

Washington, just as they worked for him in Oregon. One feels the honest and earnest good will of the man, the moment one approaches him. But above all he is reserved and unobtrusive. There is absolutely nothing of the firebrand about him, which one associates with phenomenal success in the far West. His voice is low, his words carefully chosen, his manner always dignified and cultivated. Beyond this he has left the public to guess, for he has made no effort to take part in the discussions on the floor. Those whose business it is to select the men for important work have made their estimates, however, and Senator Chamberlain has been placed on several prominent committees where his quiet influence will be quickly felt. He is appoint-

ed on the Committee on Agriculture and Forestry, and a member of the committees on Irrigation and Reclamation of Arid Lands, on Pacific Railroads, the Philippines, Printing, and Public Lands. They are good appointments and each committee has gained an earnest and efficient worker. "Work more than words," is Senator Chamberlain's creed. He was originally opposed to the plans for forest preservation, and his first message as Governor condemned them, but he says that the result of careful study was a complete conversion, and the increasing number of supporters of the recently inaugurated efforts of the Forest Service are watching Chamberlain, confident of a strong hand to help the cause along.

WASHINGTON, D. C.

The Boatswain's Whistle

BY ALICE SPICER

O FAINTLY, lightly, dimly shrill,
And buoyant as the first spring breeze—
Thus Adam's birds did haply trill,
As, newly named, they left the trees
Of Eden when they sprang to life
And skyward soared their radiant wings;
Or, elfin echoes of Pan's life—
The boatswain's whistle blowing!

Departed crews of ancient ships
Leapt up to duty at this sound;
All hands! All hands! thru human lips,
The call to labor blithely wound.
And, mighty white wings shaking out,
The anchor weighed, a fair tide flowing,
Brave answer made the oak heart rout
To boatswain's whistle blowing!

No armored cruiser's cleaving keel
Protected these, who loved their land
So single hearted, that to feel
Their own men's needs was their hand
A Jove's own thunderbolt to speed.
Sufficient, too, when gods were showing,
To smite the evil, to avert the doom—
At boatswain's whistle blowing!

From childhood's memory still it thrills
Above the harbor fog at morn;
It trills and warbles, shrieks and shrills
The tale of heroes, heaven born.
And ever as my pulses beat,
I hear the war cry of their going:
"Freedom 'fore God!" pure, high and sweet,
The boatswain's whistle blowing.

It sings bluff "Israel," bold Paul Jones;
Self-conquered, wise, intrepid "George";
And Bunker Hill's defeated bones;
Or valiantries of Valley Forge.
Americans. The Buff and Blue!
True gentlemen—their stamp bestowing
On worthy sons, and daughters true—
O boatswain's whistle blowing!

Now fainter, farther, higher dies
Its ghostly trilling—migrant bird;
A homing curlew in the skies—
When memory wakes, its voice is heard
Again a little child am I;
The wrinkled watchman's proudly showing
His tattered bells—once high and true—
That set the boatswain blowing.

THE INDEPENDENT, CHICAGO.

The Automobile Point of View

BY SCOTT NEARING

SECRETARY OF THE PENNSYLVANIA CHILD LABOR COMMITTEE.

HER father was very rich—in fact, people usually referred to him as “a millionaire,” and the horses and carriages and liveries in the stable behind the gray stone house fully justified the use of the term.

When she was very young, about twelve years of age, she had attended a fashionable Sunday School, and sat in the class of an earnest young teacher. Circumstances compelled this teacher to leave the school and it was two years before she saw Eleanor again—one bright day in June.

“Why, Eleanor, how glad I am to see you! How have you been?”

“Oh, well enough, thank you. Have you seen our new automobile?”

“Yes, I saw you out in it yesterday and it is a beauty. How do you like automobiling?”

“It’s magnificent; don’t you think so? You go so fast and the air is so cold! There’s only one thing about it that makes me tired—people will not get out of the way when father blows the horn. You might think they owned the road! Instead of hurrying they just look up at you and go on as if nothing had happened. It’s a shame; they ought to be arrested!”

“How do you like your school, Eleanor?”

“Quite well, thank you. I go most every day—if I feel like it, but sometimes it gets so tiresome. We have a funny little French teacher now. She is

so funny! Why, the other day, when I said something, she asked me if I wanted to hurt her feelings. Her feelings indeed!”

“Of course, you still go to Sunday school?”

“Oh, yes; but not the same one I used to when you taught us.”

“Why, Eleanor, I thought you liked the teacher who took my place; she was an awfully nice girl.”

“Yes, she was all right enough, but there are getting to be too many toughs in that Sunday school.”

“Toughs? What do you mean?”

“Why, don’t you know? People that wear old shoes, and hats that are out of style. You call ’em poor people; I call ’em toughs.”

“But don’t you think they need to go to Sunday school as much as you do?”

“I guess maybe they do, but I believe they ought to be kept separate, so I left and went to another church.”

“But, Eleanor, they are human beings like you; they are God’s children, just the same as you are.”

“Perhaps they are, but they ought to be kept separate because—well, because they are different, don’t you know. I am going over to Emily’s to tea now; good-bye.”

“Good bye, Eleanor.”

“After all,” mused the teacher, as she stepped thoughtfully away, “after all, aren’t they different?”

Literature

Novels from the Other Side

THERE is something older in the Continental mind than we know or understand. It is not wisdom, but a sameness in all things—in love, life, sorrow, pain—as if they had escaped on that side the happy illusion of things which we still cherish. This is peculiarly apparent in the fiction that these writers produce. Every story is the same old drama of life, lightened or darkened by the fancy and imagination of the writer. It appears to be no longer possible for any European novelist to produce an original romance in the sense that some American stories are original. Everything has been discovered there. Rene Bazin and the rest go on writing so well their eternal tales of the heart's loss and gain in love and living. It's the same old ledger of human passions with a deficit at the end, not enough happiness to go around. Pierre, the peasant's son in this novel,¹ dies of grief because he loves a great lady, who naturally does not suspect his passion. Mélu, the little weaver, grows up in solemn sadness because Pierre does not love her, nor ever suspects her love for him. The father sinks into senility because of the death of his sons. Everybody worth while is wounded and beaten thru an honorable and unrequited devotion. There is something in the French literary genius which resembles the Russian literary genius. Or, it may be more polite to put the resemblance the other way, since the French are so much the older artists. Here is Bazin, not so wise as Tolstoy, not even a shadow of Tolstoy in him, except that same capacity for portraying suffering in epic terms, not as if he were talking out of the heart of one man or one woman in the tale, but out of the heart of mankind. This is why, with all the sweetness of the French scenery, the "blond light of France" upon everything, his stories are ghost stories of human sorrows. The heart of one man may be glad, but the heart of the world

is sad, and a drear place for a novelist to live in.

Some of us are wondering what Eden Phillpotts will do about the trespassing of John Trevena upon his dramatic territory—Dartmoor in Devon.² It must give a novelist a curious turn to have another author lay the scene of a happy tale on the bloodstained ground of his own tragedies. Mr. Trevena has not entirely escaped the hardship of the Dartmoor weather in his story—which has always affected Mr. Phillpotts's imagination to the extent of making him declare homicidal manias in his leading characters, apparently to balance the wind and rain storms outside of them—but he has created in Arminel, the heroine of this story, one of the most refreshing specimens of sweetened womanhood to be found in fiction this year. And what is more to the point, the book is as good as Phillpotts could do, with this advantage, that over and above the tragedies, fate smiles rather than frowns, as we are accustomed to having fate do in Phillpotts's novels.

Stanley Weyman promises that his late story of the Irish smugglers shall be his last.³ There is no reason why Mr. Weyman should offer this inducement to his readers. And if he means the announcement for a threat, far fewer authors have enjoyed more appreciation from their readers. Besides, Mr. Weyman does not write as if he were in his last literary throes. There is the dew of the morning, the mist of Ireland, freshening all the scenes of this last story. They are laid in a remote bit of the coast of Ireland during the early part of the eighteenth century, when that country was suffering most from England's oppression, and when the sons of Erin not only learned how to evade their landlords, but how to take "dues" from every ship that was so unfortunate as to anchor off their coast. This is the significance of the title. The Irish smugglers

¹ *THE MYSTERY OF THE HEART*. By Rene Bazin. New York: Charles Scribner's Sons, 1911.

² *ARMINEL: OF THE WEST*. By John Trevena. New York: M. H. M. Yard & Co., 1911.
³ *THE WILD GEESE*. By Stanley Weyman. New York: Doubleday, Page & Co., 1911.

and coast highwaymen of those days were called wild geese. That the tale is full of adventure admirably depicted goes without saying. And we are especially indebted to Mr. Weyman for reviving a feature of earlier romances in the scenes of the imprisoned gentleman who is being starved into submission by his lady love. Only an author assured by long success would have ventured to introduce this bit of old-fashioned moral crimping into his story.

*The Straw*⁴ is the best riding romance that has appeared lately, if indeed there ever was another like it. The scenes are all laid upon the English hunting fields, with the red tail of a fox just disappearing over the next hill of the story or into the next cover. The only objectionable things that happen are when the characters clean the mud off of themselves, put on good clothes, get into the drawing-room and flirt wrong with one another. But on the whole you must think of a book where everybody is on his horse. The hero's character is incomplete, and so is that of the heroine the moment they dismount and come in out of the mire and mist of the field. The horse is not only an important part of his and her personality, but the horse provides the legs of destiny, which carry them over hurdles across the country, full tilt, not next to each other, but to the other man and the other woman whom they love and ought not to love. One feels that one might have managed the morals of the tale better but for the swiftness of the horses in getting everybody in the wrong house and with the wrong lady. The book abounds in that peculiarly flagrant wit of society people who have no reputations worth preserving, and, as usual, the evil genius of the situation is a woman—and such a woman! One curious thing about English society novels is that the female wrecker is always a loose-jointed, horse-faced, unspeakably ugly but fascinating woman. The American reader naturally wonders who set the fashion in life for this repugnant charmer in fiction.

Henry Harland's last story,⁵ which was completed by his wife after his death,

has the charm of his other novels. But the taste of the novel reader has changed since the "Cardinal's Snuff Box" was published, and for this reason *The Royal End* is not likely to be so popular. The author has attempted to connect a Venetian love affair with a New England sequel, not different from that of the famous Maid Priscilla, in the story of Miles Standish, who commanded John to "speak for himself." The result is incongruous. A love affair that begins in a gondola may move in "a high-bred manner," but it has to be manipulated too much to bring it to a New England wedding. Mrs. Harland is said to have collaborated with her husband, and we may infer that his readers are indebted to her for the very able defense of the Roman Catholic religion which the book contains. Something warns a man not to defend his Church in a novel, but nothing ever warns a woman who has the instincts of a Church-defender against the egregiousness of missionary zeal in the wrong place.

In his volume of short stories⁶ Roland Thomas has accomplished for the Philippines what Kipling's pen accomplished years ago for India. He has caught the spirit of a strange people, the vision of a strange land, enveloped in an atmosphere that is foreign and fascinating, and he has carved out of it for us comedies and tragedies of American army life in the islands, interpreted and contrasted the ideas and ideals of the little brown people with the big white ones, so as to give a sort of conviction and familiarity of life in the Philippines to his readers. The Little Gods, according to an intermittent dialog carried on between the author and a heathen priest, are the middle gods appointed by the Great God (who found it too confining to look after the men and women he had created) to manage our fates for us. The mischief they do with human destiny is called human life, and the stories in this volume are designed to illustrate the Little Gods' humor and malignancy. Every race, every separate people, has its own particular idea of fatalism, and the Little Gods represent the idea entertained by the cunning little brown people of the Philip-

⁴THE STRAW. By Rina Ramsey. New York: The Macmillan Co. \$1.50.

⁵THE ROYAL END. By Henry Harland. New York: Dodd, Mead & Co. \$1.50.

⁶THE LITTLE GODS. By Roland Thomas. Boston: Little, Brown & Co. \$1.50.

piners. The initial story in the volume, took the \$500 prize from *Collier's* in 1905 over 30,000 competitors.

Carmina. By T. A. Daly. New York: John Lane Company. \$1.00.

Two years ago we welcomed Mr. Daly's little collection of "Canzoni," and we are now glad to see some of our favorites again, with many more new ones quite as good, mostly reprinted from the *Catholic Standard and Times*. They are the sort of thing that you cut out of a newspaper and carry around in your pocket to read to appreciative friends until the clipping is worn out, and then you copy it, unless you know it by heart. Mr. Daly is poet laureate of the peanut peddler. He can also handle Irish dialect and plain English, but other people can do that, while in Italo-American he has no rival. But it is no mere display of "dialectics." The ballads have point, pathos and human nature. We must quote part of one of them:

Giuseppe, da barber, ees greata for "mash,"
He gotta da bigga, da blacka mustache,
Good clo'es an' good styła an' playnta good cash.

He leefta hees hat an' he shaka hees curls,
An' smila weeth teeth so shiny like pearls;
Ah, manny da heart of da seelly young girls
He gotta.

Yes, playnta he gotta—
But notta
Carlotta!

Carlotta, she walla weeth nose in da air,
An' look thru Giuseppe weeth far-away stare,
As eef she no see dere ees som'boday dere.

Giuseppe, da barber, he gotta da cash,
He gotta da clo'es an' da bigga mustache,
He gotta da seelly young girls for da "mash,"
But notta—

You bat my life, notta—
Carlotta.
I gotta!

The Psychological Phenomena of Christianity. By George Herbert Cutten, Ph.D. New York: Charles Scribner's Sons. Pp. xviii, 498. \$2.50.

In the present volume Dr. Cutten has made a really valuable contribution to the psychology of religion—a contribution that may be welcomed all the more warmly in the present condition of the science, because it is a collection of data rather than a presentation of a theory. What are chiefly needed as yet in this de-

partment of psychology are data, and Dr. Cutten in his search for these has past in review the whole range of phenomena of Christianity, normal and abnormal, pathological and healthful. It is characteristic of the new attitude toward religion that an attempt would be made to classify and explain its phenomena from the point of view of the mind that receives and molds it. Dr. Cutten has drawn largely on many of the recent works on religious psychology, especially on Professor James's "Varieties of Religious Experience" and Davenport's "Primitive Traits in Religious Revivals," with both of which authors he is in substantial agreement. His book is, however, much more than a restatement of facts and conclusions reached by former writers. He passes in review first what may be called the abnormal phenomena of Christianity, such as ecstasy, witchcraft, monasticism and revivals, and then considers the subjective factors, such as age, sex, imagination, prayer and denominationalism. The last chapter on preaching is of a somewhat different character from the rest of the volume, being almost of the nature of a manual of instruction for the young preacher, which seems a little out of place in relation to the rest of the volume. No theory is put forward as explanatory of the phenomena, but Dr. Cutten tells us in the preface that he hopes to make this volume of data the basis of a further work which shall set forth his theory. The value of the book to students would have been much enhanced had Dr. Cutten added a bibliography of the literature of the subject.

The Fabian Essays in Socialism. Edited by George Bernard Shaw. Boston: The Ball Publishing Company. 50 cents.

When this group of essayists, twenty years ago, stripped socialism of her revolutionary red and presented her to Great Britain in a Quaker-like garb, they did not know that she would soon be welcomed in ducal drawing rooms and episcopal palaces, nor that her sponsors would win international reputations—Mrs. Besant as theosophist, Sydney Olivier as a Governor of Jamaica, Sidney Webb as economist, and G. B. Shaw as playwright. The Fabians have made socialism as respectable as Liberalism or Con-

servatism, certainly no more feared and loathed by the timid wealthy than the radicalism of Lloyd George, England's Chancellor of the Exchequer. So great a change has come over public opinion, both in America and England, since this book was first issued, that its teachings are denied the label "Socialism" by conservatives as well as fanatics. An eminent clergyman in New York, distinguished for his onslaughts on "socialism," recently said that he had read these essays and found in them only two minor socialist proposals. It is wellnigh impossible to bind anybody down to a comprehensible definition of this subject. Every man claims to define socialism, as Mark Twain said he should spell, "according to the dictates of his own conscience." However, the rare citizen who is willing to reason logically as well as feel humanely will find this book most helpful. An economic work which has circulated by the tens of thousands and stood the test of twenty years has the authority of a classic. Probably the American reader, accustomed to mix up socialism with the anarchists and the Chicago riots and with bomb throwing, dynamite and shooting among Western miners will find the pages disappointingly sane, practical and dull. If he yearn afterward for a more stimulating diet he may go to the little local sects called "the Socialists," who, he will find, repudiate this exposition. When he has spent some time in their tumultuous company, he may judge the truth of Shaw's words in this preface:

"Their worship of Marx (of whose works they are for the most part ignorant, and of whose views they are intellectually incapable) and their repetition of shibboleths about the class war and the socialization of all the means of production, distribution and exchange have no more application to practical politics than the Calvinistic covenants which so worried Cromwell. . . . These little sects are ignorant and incapable in public affairs and in many cases their assumption of an extreme position is an excuse for doing nothing under cover of demanding the impossible."

Blackstick Papers. By Lady Ritchie. New York: G. P. Putnam's Sons. \$1.75.

These essays on various subjects are all very slight, very easy and very agreeable reading. Indeed, they are rather chats than anything else. The themes are of no great consequence in them-

selves; the interest centers in the writer. It is a good deal merely to be in the company of one who has seen George Sand and known Turguenieff and has heard Mrs. Gaskell tell ghost stories, even tho she has little or nothing in particular to talk about. There is always the chance of a reminiscence, a stray allusion, the stirring of a great memory. And tho these recollections, when they do come, are not always what one would choose from a daughter of Thackeray, they are something—a certain salvage from oblivion.

The Monuments of Christian Rome from Constantine to the Renaissance. By Arthur L. Frothingham. New York: The Macmillan Company. \$2.25.

This volume is the latest addition to the valuable series of "Handbooks of Archeology and Antiquities" edited by Professor Gardner and Professor Kelsey. Professor Frothingham's work is quite up to the standard set by his fellow workers, tho from the nature of his subject and the great extent of time covered it has not the same sustained interest some others have had. The author was fitted for his work by many years of residence in Rome; during part of this time he was connected with the American School at Rome. In his treatment of his wide subject Professor Frothingham has divided his material into two sections of unequal length. In the first, the briefer, he gives a general survey of the entire period, tracing the art history of the city of Rome from the age of Constantine to the end of the "Babylonish Captivity," or the latter part of the fourteenth century. In the second, he studies the monuments systematically and according to their respective classes. In the former he works out his thesis, entirely correct we believe, that the art of the Middle Ages can be understood only as studied in connection with the political, social and religious development of the people, with all of which it was inextricably bound up. In the earlier part of this development the author is disposed to find more of Byzantine influence than has hitherto been customary; and in the latter he attributes to Rome an influence upon the revival of painting and sculpture in Italy which has commonly been associated with Tuscany. The second section of the book, "Classification of the Monuments,"

is not only an invaluable vade-mecum for the student of archeology on the spot, but a mine of information for the general student of history. It is carefully arranged, is accurate in its detailed information, and is abundantly and clearly illustrated and not merely embellished with pleasing pictures. The literary style inclines somewhat to the ornate, but it neither makes demands on the reader's patience by any lack of clearness nor wearies him by verbosity.

Literary Notes

....Vols. XXIX and XXX of the Studies in History, Economics and Public Law, edited by the faculty of Political Science of Columbia University, are, respectively, *New Hampshire as a Royal Province*, by William Henry Fry, D. D., and *The Province of New Jersey, 1664-1738*, by Edwin P. Tanner, Ph. D., the latter being an account of the political institutions of New Jersey during the period of her executive union with New York. (Longmans, Green, \$4.00).

....A vast amount of curious information, hitherto left uncollected and in peril of being lost, will be found in Charles Frederick Carter's *When Railroads Were New*, an anecdotal history of the early stages of railroad building and railroading in the United States, of their financing, the public attitude toward them, and a hundred other things, including accounts of the early locomotive builders, the ways of early conductors, also the ways of politicians, the struggle with waterway interests, and many data that will prove of value to the future historian of the American railroad. In fact, as *documents pour servir* these chapters deserved the preservation in book form given them by the publishers. And, in addition to all this, the book is good desultory reading for the layman. (Holt, \$2.00).

....Lovers of the curious will find something to their liking in *A Book of Witches*, by Oliver Ford Maddox Hueffer, who opens his pages with a discussion of the possibility of a revival of witchcraft, or at least the belief therein. Within a few miles of London, he says, this belief persists unaltered among the British peasantry; it is as familiar among the ignorant of Europe as in Darkest Africa, and, what is more, it appears (at least Mr. Hueffer thinks so) to be making headway upward again among the more classes. In their interested dilettante investigations of obscure phenomena, their dallying with devil worship, and the like. The book is mainly, however, a history of the witch, her ups and downs, her life in the Middle Ages, and her persecutions during the seventeenth and eighteenth centuries. Spells, charms, incantations come in for the full attention they deserve, the author's fancy playing amusingly with the numerous of the world's most weird of its superstitions began. (John McBride Co., \$2.50).

Pebbles

THE new Senator from Kentucky, W. O. Bradley, has defended 107 men charged with homicide, and only four of these were convicted by the courts. It is rather remarkable that a useful citizen like this should be allowed to leave Kentucky.—*Columbia State*.

It is easy enough to be pleasant

When life goes on like a song,

But the man worth while is the man who can smile

When the telephone rings and he answers it and says "Hello!" and the operator says, "What number?" and he says, "The bell rang," and she says, "No, it didn't."

—*New York Evening Mail*.

THE college man wrote home to father.

"Dad," he said, "I can't get along with that two-passenger runabout any longer. I must have a touring car. You see, dad, every time I take one of the professors for a ride at least five other professors are as mad as blazes over it. You never saw such a jealous lot of fellows. I want a six-seated Whooper of the 1909 model, dad."

He got it.—*The Cleveland Plain Dealer*.

A NEW YORK produce commission house, which prides itself on filling all orders correctly, received a letter from a New Jersey customer recently saying:

"Gentlemen, this is the first time we ever knew you to make a mistake in our order. You are well aware that we buy the very best country eggs. The last you sent are too poor for our trade. What shall we do with them?"

The fair fame of the house for never making an error seemed to be at stake, but the bright mind of the junior partner found a way out of it. He wrote:

"Gentlemen: We are sorry to hear that our last shipment did not suit you. There was, however, no mistake on our part. We have looked up your original order and find that it reads as follows: 'Rush fifty crates eggs. We want them bad.'"

It was the dreamy hour, when the Christmas dinner, having been eaten, was doing its best to digest itself, and the girls were talking in the hushed tones appropriate to the occasion.

"I've just heard of a new charm to tell whether any one loves you; and, if so, who it is," whispered Elsie.

"What is it?" queried Sophie, absently fingering her new diamond ring.

"Well, you take four or five chestnuts, name them each after some man you know, and then put them on the stove, and the first one that pops is the one that loves you."

"H'm," said Sophie. "I know a better way than that."

"Do you?"

"Yes, indeed. By my plan you take one particular man, place him on the sofa in the parlor, sit close to him with the light a little low, and look into his eyes. And then, if he doesn't pop, you'll know it's time to change the man on the sofa."—*Woman's Home Companion*.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York.

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, \$2.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of *The Independent* are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

Proposals for Compulsory Peace

THE ideal plan for universal peace is by universal agreement thereto. That is what the Hague Conferences are aiming at—that the nations shall agree to substitute law for war, and to refer all differences of whatever sort to arbitration and settlement by an impartial Court of all the nations. How soon that may come we cannot say, but it will come in the end by a universal treaty. The peace campaign—to use a term of war—moves rapidly, and we may be nearer a universal treaty than we think. But we need not wait for that, for dual treaties can be made by the fifty-nine nations, each making fifty-eight treaties. The United States has recently concluded twenty-three arbitration treaties, of a sort, but we want fifty-eight which shall include all possible causes of difference. Then we shall need no more to support a powerful army or navy.

Such a Court of the Nations as we anticipate accepts the method of constitutional legality, like that by which our several States consent that all differences shall be settled by the Supreme Court. But there are also proposals of another sort for compulsory peace, which are evi-

dence of that mighty change in public thought and opinion which indicates an approaching Pacific revolution. To some of these we call general attention.

One such plan is already in practical working. It is the agreement of the five republics of Central America to refer to an arbitral court all differences between themselves, while the United States and Mexico stand behind with their armies and navies to see that this agreement is observed. It is a beautiful agreement, but would be thrown to the winds if it were not for the big stick to enforce it. Indeed, any treaty, like some of old standing, by which two or more Powers agree to protect a third against invasion, or such a treaty as that between Great Britain and Japan, is in a measure a treaty for compulsory peace. But it is of other proposed plans for peace by force to which we would now call attention.

One is that urged by Sir Max Waechter and expounded in the form of an interview by Charles Lowe in the *March Contemporary*. A conference in support of it attended by men of various nations has been held in Rome this week, and Sir Max has interviewed the rulers of Europe in its behalf. He looks out to the growing strength of the United States and of China, and sees therein a serious danger to Europe. The United States will, he says, by the end of this century, be stronger than all Europe, while China will be many times more powerful than Japan. He sees a yellow peril in the East, and a possible peril in the West. He would have the nations or Europe organize a defensive peace league, which would be a friendly arbitral agreement as between themselves, and a protection of force against any attack from without. We do not see any great wisdom in either the fear which underlies the proposed league, or in the exclusion from it of nations of other continents. It would be easier to get Japan and the United States to join such a league than it would to persuade Germany and Russia. Further, it is not at all likely that the United States, even with the addition of Canada, will during this century be superior in strength to the united European nations, for Russia will include a third of Asia, and a part

of Asia which will grow as fast as the United States. Further, it is a very far cry to the time when China, even aided by Japan, will care to attack Europe. We see nothing practical in Sir Max Wechter's plan. It is either too big or not big enough. It will be easier to create the grand league of the nations.

Another plan is that proposed by Professor Hershey, as given in THE INDEPENDENT of this week. That, too, is based on fear, but this time fear of Germany. He holds that Great Britain has good reason to fear German hostility, and that we also have reason to fear it. He says that Germany is determined to be supreme on the sea as well as on land, and this with a view to some future conflict with Great Britain. Germany, he also says, resents our Monroe Doctrine, and the time is liable to come when German expansion, presumably in South America, will lead her to send a fleet with which we could not cope, to add to her colonial possessions, after a war with, say Brazil, whose sovereignty and territory the Monroe Doctrine requires us to protect. He would therefore have the United States and Great Britain unite in a treaty to support each other in case of such a war. The two nations together could forbid Germany to make war on either of them. It would assure a compulsory peace, a peace based on the superior united fleets and armies of the two nations. Such a proposed treaty would be much like the Anglo-Japanese treaty, which was directed chiefly against Russia, and would have the same disadvantage that it is based on a special apprehension and against a specified Power, and so would be likely to perpetuate and increase ill will. Nevertheless, so far as it goes it would be an insurance against war, but would imply the maintenance of immense and costly navies.

A third proposal is that by Mr. Henry G. Granger, in THE INDEPENDENT of April 22d, and said to be favored by Mr. Carnegie. His proposal is based on no hostility and no particular apprehension. He would have the five strongest Powers in the world, Great Britain, France, Germany, Japan and the United States, join in a compact to remain at peace, and to require all differences to be settled by The Hague. He adds that if the five nations could not be induced to enter in the plan

Great Britain and the United States joined by any third Power could ensure the adhesion of the rest. He would also have the President appoint Mr. Roosevelt at the head of a commission to secure this league of the nations. This plan has its advantages, as we have already said, and its achievement would be magnificent. It would involve, however, the prior agreement of these nations to refer all their own differences to the Hague.

But all these are provisional and partial and look to compulsion, when what we want is peace of law, the law of nations, law under a parliament of the nations centered at the Hague. Let the work planned by the last Hague Conference be completed. Let President Taft appoint the commission to study disarmament proposed by the Chicago Peace Conference, and let it prepare plans along these or other lines or any better, as a basis for the work of our delegation at the Third Hague Conference in 1915. Let the Court of International justice be organized. Meanwhile let our Secretary of State at least attempt to negotiate arbitration treaties of the widest possible scope with all other nations, awaiting the larger plans of The Hague. Such steps as these will tend to reduce the feverous war scares and apply sedatives for the prevalent naval hysterics.

Developing the Country

FOR a hundred years the American politician, the industrial adventurer and the promoter have employed one final and clinching argument in behalf of any measure which encountered scepticism or suspicion. All other arguments might fail, but this one never. The project in view would "develop the country." That has settled it.

So far as our information goes, very few influential inhabitants have ever asked the previous question: "But why develop the country?" Never, perhaps, since Pithecanthropus Erectus left his bones in the pliocene mud of Java has the human race taken possession of so magnificent a heritage as the middle belt of the North American continent was when the white man came here. No-

where were such forests of hard woods and pines still flourishing. Nowhere were the forms of animal life so varied or so beautiful. Nowhere were the boundless prairies so fertile. Nowhere were the deposits of gold and of silver, of copper and of iron, so fabulously rich. Nowhere were there such supplies of mineral fuel. Conserved and used with any sort of reason, they were adequate for the needs of an enormous population for a thousand generations.

But the very magnificence and seeming inexhaustibleness of these resources awakened in the American branch of the white race an unprecedented passion for destruction, a reckless indifference to the future, and a spirit of wanton wastefulness. In less than three hundred years this prodigal folk has literally skinned its habitat. It has skinned the mountains and the hills where the forests were. It has skinned the arable land. It has skinned the beasts and the birds. Entire species have been annihilated, so that no individual specimen of them all will ever again be seen on this planet. Its methods of agriculture have aptly been described as "mining." In other words, they have been the actual removal without restoration of the essential elements of fertility.

This is how we have "developed the country." And yet, even now, any monstrous scheme of further destruction has only to plead that it will "develop the country" to get whatever legislation it wants, and raw speculative lambs to its shambles as the tunes of the Pied Piper drew rats to destruction.

Developing the country, forsooth! We have done it with a vengeance, and what have we to show for it? A struggle for existence that is becoming fierce and portentous; an industrial society controlled by multi-millionaires at the top and operated by a motley mass of unassimilated foreign-born at the bottom; with "Pittsburgh" as an untranslatable American byword to express the concentrated essence of the whole!

Before this developing business was fairly under way we had a population, not homogeneous, indeed, but so far approximating homogeneity that it was possible to maintain the reality of demo-

cratic government in local, and of deliberative government in State and national affairs. Today, in both city and State affairs, we are everywhere abandoning the deliberative principle, declaring legislative bodies to be useless or dangerous, and, in the old Roman way, placing well-nigh absolute power in the hands of individual executives elected for limited terms. There is nothing mysterious in this political transformation. It is the inevitable consequence of extreme heterogeneity. One-man power is the only form of government possible to a community occupied in building a tower of Babel.

Without raising any question of the economic validity of the opposing theories of free trade and protection, it may without any fear of contradiction be said, that the riotous kind of "protectionism" that we have created in the United States has been a policy for "developing the country" in precisely the sense here set forth. Its object has been to create a manufacturing industrialism in place of a simpler rural life; to attract an indescribably heterogeneous immigrant population; to create the greatest possible inequality of economic condition. One has only to read the protectionist arguments from the days of Alexander Hamilton down to discover that, as Horace Greeley used to put it in his *Tribune* editorials, and as Henry Carey elaborated it in his voluminous disquisitions, a homogeneous agricultural population living a simple life was to the protectionist mind an absurdity.

We are not saying that a different policy could have been followed, or that, if followed, the results would have been better. We are only calling attention to certain relations of cause and effect. The American nation did not want to lead the simple life. It did not want to be homogeneous. It wanted to be big, powerful, complex and glorious. It has got what it wanted. It has become what it wanted to be. But it so happens that in this particular universe in which our lot is cast it isn't possible to get everything that we want without paying the price. We have had protection of the log-rolling sort on a gigantic scale. We now have capitalistic industrialism on a

stupendous scale. We have packed human beings by millions into the tenement houses of monstrous cities. To a great extent we have substituted the almost childless farmer and his wife, with their incompetent hired man (when they can get one) for the big and happy country families of the older time. We have raised tremendous problems of government and of the economic "class struggle." And we have "developed the country!"

"These be thy gods, O Israel."

Tariff Revision

LAST week's votes in the Senate must have enlightened those who had not foreseen, from the day of the introduction of the Aldrich committee's bill, the legislative result of all this tariff discussion. The Senate's bill is to be substantially a re-enactment of the present Dingley tariff, with the addition of "snaky" increases—all of which, probably, have not yet been brought to light—and with a few reductions that will give no relief to consumers. To this bill will be attached provisions for an addition of 25 per cent. ad valorem to the entire list of duties, to be levied upon goods from all countries not specially exempted by Presidential proclamation. There are rates which, as we have said heretofore, this maximum addition would multiply by two, or even by three. Tariff wars might be provoked by it, and the enforcement of such a provision could not fail to increase in some measure the ordinary rates of tariff taxation, incidentally enabling protected combinations to raise their prices above the limit fixed by those rates.

This is the bill which is to be passed in the Senate. It now has the support of about four-fifths of the Republican members, and probably not more than two or three Republicans will vote against it at the final call of the roll. Altho the so-called insurgents have attacked it with severe and memorable criticism, they have in the main sought only to prevent an increase of the Dingley rates, and two or three of their leaders have announced their purpose to vote for the bill at the end. Criticism from men

whose support was thus pledged could have little effect upon Mr. Aldrich and his associates. He has been able, moreover, to rely upon the aid of Democrats. Eighteen of them voted against putting iron ore on the free list, thus outweighing the votes of fourteen Republicans who sought to preserve one of the commendable features of the House bill.

Occasional rumors, last week, of impending surrender by the Aldrich majority could only have amused those Senators who knew that majority's leaders. There will be some trading, here and there a rate may be slightly modified to conciliate a complaining Senator; but it is the purpose of the majority to carry the bill to final passage substantially in its present form, and then to complete their work in the conference committee. A great deal of nonsense about reforms in conference has been put in circulation. It is said that even Mr. Taft has been looking to the conference committee for the reductions which so many desire. That committee will be controlled by those who made the House bill and those who are now shaping the bill of the Senate. And its work will be confined to those duties as to which the two bills disagree. In all probability the Senate rates will be higher than those of the House in a large majority of the cases which the conferees will be empowered to consider, some of them having been made higher to provide material for trading. If this be borne in mind, the general character of the conference work can be foreseen. The final result promises to be something worse than the House bill.

Downward revision was expected by the people. It was virtually promised by the Republican party and by Mr. Taft, altho the latter held that there might be a few duties that should be increased. It is true that downward revision was not promised in so many words by the Republican platform, but that platform's restriction of duties to the differences of labor costs, plus reasonable profits, was generally regarded as meaning revision downward. It was known that there were duties exceeding the entire labor cost, to say nothing of differences between labor costs here and labor costs

abroad. A bill honestly constructed in accord with the rule laid down in the platform would present duties much below, both individually and in the average, those of the present tariff, which were intentionally made unwarrantably high to allow for the reductions of a scheme of widespread reciprocity.

The people were not led to expect a revision that would increase the general average from 44.16 to 45.72 per cent. Mr. Payne admitted that his bill called for this advance. They did not expect the additions of the Aldrich bill. Nor were they asking for the further increases involved in the House bill's maximum of one-fifth more, or in the Aldrich maximum of 25 per cent. to be added even to a duty of only 15 per cent. Did Mr. Taft have such a revision upward in mind when he said, in December last:

"Unless we act in accordance with our promises, or if we only keep the word of promise to the ear and break it to the hope, we shall be made accountable to the American people and suffer such consequences as failure to keep faith has always been visited with. It would be better to have no revision at all, unless we are going honestly and fairly to revise the tariff on the basis promised by our party."

When the bill is laid before him for his signature or disapproval what is he to do, if he is convinced that it is not such a revision as was virtually promised and as ought to be made? The answer to this question depends in part upon conditions which cannot exactly be foreseen. While we do not expect that the serious defects of the pending bills will be removed before final enactment in Congress, it is possible that some changes for the better will be made in the coming two months. In that case, Mr. Taft might be led to withhold a veto, and even to sign the bill, because of the effect of his action upon the condition of business. Trade and industry are waiting for the completion of this legislation. A veto would check recovery from the depression which followed panic. Perhaps it will not be an easy matter for the President to determine what he ought to do. At all events, if he shall decide to sign a bill which represents a broken promise, he will doubtless express his reasons fully and give censure to those who shall deserve it.

Experiences of Woman's Suffrage

THE letters we publish this week of the experiences of woman's suffrage are nearly all favorable to the plan, altho in one or two sections we are told that no particular advantage comes from it. But it is evident that were a poll to be taken of the people in the States which give the ballot to women we should find the women overwhelmingly in its favor and the men either favorable or indifferent. We do not learn that the women attend primary meetings any more faithfully than men do; that, indeed, they do not bother much about them. But that is of no importance in States that are adopting the direct primary system, the purpose of which is to overcome the evils of abstention and boss rule. It is, however, of great importance that under the continuance of the old caucus system the political leaders are much more afraid to put up an objectionable candidate. They ask, What will the women think of him? and the women are much more likely to scratch the ticket than are men; and scratching is the salvation of politics, the chief safeguard against the election of bad men.

We do not learn from these letters that women are led to forget womanly duties or neglect their homes. They fail to see that it takes longer to go to the polls than it does to call on a neighbor. And they do see that it broadens their intelligence, gives them a wider view of public affairs, and so increases the worth of living. Nor is it a fact that homes are broken up by the political differences between men and women. Indeed, wives often vote a different ticket from that of their husbands; but it is an old story that women have ceased slavishly to accept whatever their husbands say.

For more than half a century THE INDEPENDENT has been the advocate of woman's suffrage. Even before our original campaign for the overthrow of slavery had accomplished its purpose we took up that of the enfranchisement of women. In those days there were few to approve it. Its advocates, such as Lucy Stone and Mrs. Stanton and Miss Anthony, were thought to be as crazy as the more noisy English suffragets are now held to be. But during these years we

have seen the cause grow into such strength that we hardly need longer to defend it. Most States, except Texas, have repealed the laws which deny women the control of their own property; and the more progressive young American States and British colonies, and even European nations, have given women the same political rights as men have possessed. The victory is sure if not yet complete. The old Eastern and Southern States simply lag behind. THE INDEPENDENT will live to see woman's disfranchisement as generally condemned as is slavery now; and we have a similar faith for the victory of half a dozen other reforms, religious, political and educational, which we support. Even an absolutely phonetic system of writing is one of the divine decrees, because it is logical and right.

Work and Worship

IN the sermon by the Rev. Dr. William T. Manning, Rector of Trinity Church, in this city, devoted to a defense of that church against its critics, Dr. Manning concludes with an account of the large work done by it for the poor, and then says:

"I pray that this Parish may never be led into the mistake of giving the Second Commandment of our Lord Jesus Christ the place that belongs to His First and still greater Commandment, or of allowing Work in any measure to usurp the place of Worship."

Beyond all question the infinite God is greater than finite men; but so long as our finite powers can grasp at only a finite portion of infinity, no more of the infinite than we can of the finite, it may be that our duty of love and service for our fellow men, whom we have seen, may be quite as great as our duty of worship of God, whom we have not seen. So far as effort and thought are concerned it may be greater. It may be that the best expression of worship of God will appear in work for men. Indeed, this is the measure of truth in the poem which tells us that "Ben Adhem's name led all the rest."

The Scriptures have a way of even putting duties to our fellow men before duties to God, as if the former were the measure of the latter. The question is

asked very definitely: "What doth the Lord require of thee?" and the answer is, "To do justly and to love mercy, and to walk humbly with thy God"—work before worship. Again, when the question is asked, "Who shall ascend unto the hill of the Lord?" the answer is the same; "He that hath clean hands and a pure heart, who hath not lifted up his soul unto vanity and hath not sworn deceitfully. He shall receive a blessing from the Lord"—duties to our fellow men put in the front rank as if they were the expression and measure of love to God. This is precisely what Saint James emphasizes in his famous defense of works as against faith.

Both worship and work are liable to degenerate into formalism. Our Lord has not a word to say commanding the forms of either work or worship, beyond the establishment of a most simple expression of brotherhood in a meal together, a supper which as first inaugurated had no formality, but was characterized by familiar conversation together. The very essence of Christianity as a reform of Judaism, was the insistence on the spiritual to the disparagement of the ceremonial. Even worship, as our Lord described it, was to be private and secret. The Samaritan who cared for the man who fell among thieves rendered the best worship. We believe in worship, but faith in God is to be best expressed in works for our fellow men. Obedience to the second command of the law is the measure of obedience to the first.

The Real Literature of Love

WE must not forget the love proportion in what is going on around us, nor the important part it plays in the results. So much more is written of other things—of financial and industrial matters, of great political enterprises, and social reforms, of science and art—we do not realize that the great bulk of the world's correspondence is written in love from one sex of foolish, happy, thoughtless young people to the other—young people as ignorant as turtle doves of all branches of economics, and very far removed from any ambition to save the country with moral inquests over morbid conditions.

They have discovered one secret, the happiness of being in love. They have one expectation, the expectation of lovers. They have one fortune, the fortune of being able to love.

They are the authors of most of the current literature of the day, all of the real love literature. Novelists are only picturesque liars about love, and what they write is, as a rule, no more like real love than the stage is like real life. And this literature has a currency quite independent of the news-stands, nor can any regulation of the News Trust affect it. The Government considers it of such importance that postmasters and postmen are paid to deliver it, with the smallest possible delay, at the door of every home where youth dwells—in the factories, in the tenements, huts, cabins, camps, tents, shops, stores, offices, everywhere! They are the greatest propagandists in the world, these young underwriters of destiny, and they are the most effective. With what divine inspiration they impart to each other their simplest thoughts and feelings! And with what tenderness their confidences are received—with what immeasurable belief! If the leaders and reformers of men could inspire it, what a quick relief we should have from all our old woes, how soon we should acquire new ones!

Life is a long darkness. The sun and the moon do not light it. They merely light the heavens and the earth. But men and women are the only lights in life for each other. They are the altar candles that discovered God. They are the little love tapers that go up and down for awhile between the dark hills of mystery and then disappear. It is when they disappear that we miss them. When some one ceases to love some one else, when he passes on, or dies near by, the whole world feels the loss without knowing what it feels. But if all the literature of real love should cease at once, in a day, if the postman should go about with a lean bag, like a beggar, delivering only duns and orders, we should know. We should miss something dear and hopeful, as we should miss the sweet mystery of the stars on a clear night. Virtue would have gone out of us, and silence and

stillness and those premonitions that are of death would come upon us. No economist could deal with the awful disaster if love should leave us; no convention, however composed of the wise and great, could restore it.

This is why more respect is due to the literature of real love. We ridicule it because we are not in love; we do not feel the incantation of the simple, foolish young words. We do not realize that in these pretty, square, violet-scented, crested, love-mounted envelopes is sealed the prophecy of the nation's future, that it is not nearly so dependent upon the digging of the Panama Canal, or the reform of the tariff, or the solving of capital and labor problems. By the time these young lovers have seized the helm of affairs there will be another canal to dig somewhere else, more reforms needed, other problems to solve. But if they marry, if they are faithful to love, if they are good parents, they will have less trouble than we have had with the trusts and other scandals growing out of the perversities of untrained human nature.

The mind of a man is never so wonderful as when it interprets adequately some phase of the spirit of man. Compared with this all other thinking becomes mechanical. But now and then the common man arrives at the place where he becomes a genius with a god resident in him and with a new impression of love. We should recognize it as old, but it is really new, because it is his, and has changed and inspired him and made him that was so simple wise. It has carried him a wing's width further into the sweet mystery of life. He writes it all to the maid. We could not see it, even if we saw the letter, but she will see it—the wise, tender eyes of love translating behind the halting words. And behold how she receives love. With what fears she shields, hides her own, as a woman shields the slender candle flame with her hand when she would look far into the windy darkness. It is we who are foolish and sacrilegious when we smile as if such things were of no importance—and it means that we have coarsened until we cannot interpret the loveliness of the one miracle that is left to us to cherish.

On Being Gay

It is well to be in earnest, when one has work to do. It is well to be serious, on meet occasions. But a people, like an individual, can make a hobby of earnestness, and ride it strenuously. An individual, or a people, can cultivate seriousness as a conventional mark of respectability. A cultivated seriousness and a systematically prodded strenuousness commonly create a habit of thinking of one's self more highly—and more persistently—than one ought to think. It used to be said of Americans—meaning particularly them of the Puritan stripe—that they took their pleasures sadly. The observation would be less true to-day. We are well over the old feeling:

"There's such a charm in melancholy,
I would not if I could be gay."

It would be more accurate now to say that we take our pleasures badly. We have broken away from puritanical restraints, and we are proclaiming our emancipation with much noise, buffoonery and hoodlumism. We like scenic railways and hilarity, concert hall music, "boiled live lobsters," and "scorching." Our reaction from the cult of seriousness is crude and superficial. We have become addicted to amusements. We have not yet mastered enjoyment.

The French *gai* retains perhaps better than the English *gay*, the early connotations of *beautiful* and *good*. As a people, we have not learned to be gay. Apparently, we do not quite know how, and, apparently, we lack some of the instinctive factors of spontaneous gaiety.

To be gay, we must first of all be light-hearted, and the American people, with all its furious devotion to amusements, is not altogether light-hearted. It worries overmuch about the practical concerns of life, and is too obsessed with the importance of "beating the record" in every undertaking. And, even if we were light-hearted, that alone would not enable us to be gay. For being gay is, in some sense, an art. It calls for measure and discrimination. Above all, it is incompatible with vulgarity. Unhappily, as a nation we are so far from knowing how to be gay that at least fifty million persons in our total population of more than eighty millions suppose that they are

gay when they are somewhat vulgar only. On the other hand, we shall not learn how to be gay if we depend altogether upon a diligent cultivation of esthetic standards. These may help us to be discriminating, but they cannot create light-heartedness. Neither can we create it by joining *en masse* a national society of optimists. Not only the beautiful, but also the good is connoted by the primitive meaning of gay. But it is goodness of a particular kind, or in a peculiar sense, that is implied, and that is essential to light-heartedness. It is the goodness, not of the calculating mind, but of the unspoiled and generous nature—that nature that bubbles over with good spirits and kindly impulses.

We cannot create the elements of gaiety by statute, nor yet by much preaching. Happily, it is unnecessary ever to create them. They are born in the heart of every generation, and they would live for our well-being and enjoyment, if only we did not smother them with sordid aims and wretched striving with one another for possessions that yield us little satisfaction when we have obtained them. If we would learn to be gay, we must permit ourselves to be light-hearted by more carefully selecting our ambitions.

Some other conditions also are necessary. We must have about us the things that provoke the disposition to be gay, and that bring the element of discrimination into our daily relaxations. If we really thought it worth while to be gay, we should care more than we do for color. Above all, we should care for flowers. The American indifference to flowers is a curious but accurate index of the American mind. If the householder of Rotterdam or Cologne had to choose between the bank of shrubbery and flowers, six or eight feet wide, under his front windows, and costly carpets or electric lights in his rooms, he would not forego the flowers. He would be quite unable to understand the minds of men who can vote millions of dollars for the "decoration" of feloniously ugly public buildings, while unable to afford a glorious wealth of flowers in the parkway spaces of such a street as upper Broadway in New York City, or in the barren wastes of the new City College grounds.

Here and there in the United States,

conspicuously in Boston and in Washington, and in a lesser degree in the cities of the South and West, a desire for external beauty is beginning to find expression. Slowly, perhaps, but surely, we believe, the American mind will revise its notions of what things in life are most worth while. Some day we shall care less for speed and more for what we might leisurely look at on the way. When that day comes, we shall discover that light-heartedness too has come, and then, perhaps, with less costly, if not fewer, amusements, we shall begin as a people to be more gay.

People do not like to be ruled. They would rather rule themselves badly than be ruled well. On the whole it is better that they be humored in their choice, unless they disturb other people. We are learning that lesson in the demands of women to take an equal share in the rule of the State as well as of the home. We are now having trouble about the government of Porto Rico, which has but one thing to complain of, that we do not consider her yet ready to be trusted with her own government. By the right of Presidential veto of any acts of her legislature, a right never exercised, and by our majority of Americans, 6 to 5, in her Upper House, called the Executive Council, we hold a check on any legislation attempted by her elective House of Delegates. This House of Delegates insists on legislation for an agricultural bank, and for sixty-six elective judges, and for the appraisement of property for taxation by the heaviest taxpayers, etc., bills which the Executive Council refused to agree to; and in resentment the House of Delegates refused to make any appropriations to carry on the Government. It adjourned, and when called in special session still refused, and again adjourned. Now will come governmental chaos, unless our Congress takes action; and President Taft, in a very plain-spoken message, asks that the Foraker act, which created the Porto Rico Government, be amended by continuing the previous year's appropriations in case the Legislature has failed to act. This is a simple necessity. Thus far Congress has

dealt very handsomely with Porto Rico, in all but one thing. As President Taft says in his message, it has turned all the customs and internal revenue receipts into the island's treasury, and besides paid many other expenses; has greatly improved the school system and the public roads, has given the island full free trade with the United States, and created a condition of progress and prosperity such as it had never known before. One more thing we ought to do—grant full citizenship to the people, and then look for a Territorial government as soon as may be.

President Eliot's Declaration

President Eliot declines the honor which President Taft had the honor to offer him, of the Ambassadorship to the Court of Saint James. We wished he might accept, and yet we approve his declination. We approve it chiefly because of President Eliot's age. At his years the responsibility, and still more the labor, is more than a man of his age can safely take on himself. He has done a good life's work, and, while he should not cease to work, he should choose his work according to his strength and taste, and not find it a burden. Further, we regret that he could not accept it for the reason that we would have liked to see in London as the American Ambassador one who should live with dignity, on his salary, and not with display. We offer no criticisms of the present Ambassador. If a man has money he can well use it for social functions; but we would have it understood that a man without wealth, like our Ambassador at Berlin, will have equal honor and influence. Yet for another reason we are somewhat satisfied that President Eliot has declined. The post properly belongs to one trained to diplomacy. To be sure, this requisite is less evident in the British post than almost anywhere else, for we can expect few very strenuous differences, and the courtesies of public and literary functions count for very much. Yet the rule is a good one, that diplomatists should be trained in diplomacy, and should rise from one grade to another. That has not been our custom, but we have of late years been coming to it.

Church Federation

This is what Dr. Huntington, of Grace Church, in this city, admirably said at the Episcopal Church Congress in Boston last week:

"It is thought by many that the two chief concerns of the twentieth century are to be the conquest of the air and the conquest of the ether. Really, the two chief concerns of the twentieth century are to be international arbitration and the unification of the Christian Church."

As to the hope of Church union by federation Dr. Huntington said:

"The Federal Council of the Churches of Christ in America is indeed a body worth taking into account. Its meeting last year in Philadelphia was indeed a memorable event, and its report just issued is an epoch making volume. But are thirty denominations really closer to one another for having been glued together at the edges? Must not the lines of union in such a case continually threaten to become lines of fracture? The effort shows splendid courage and a most praiseworthy faith, but it seeks to mingle forms of polity which cannot coalesce."

Why lines of union should become lines of fracture we fail to see. The parts will rather adhere more closely, under the welding of the Christian spirit and thus cohere and then coalesce. But we remember that the Episcopal Church has held a rather stepsisterly relation to the Federation. Dr. Huntington's own plan of union is not made very clear. He calls it the "constitutional theory," and says it contemplates "such a merger as conserves the rights of all parties," laying stress on "representative government." But government will be dangerous. He says:

"Unless the Episcopal Church bases itself fairly and squarely on this that I have termed the constitutional ground it will be in great danger, humanly speaking, of being badly bruised between the upper millstone of the Roman denomination and the nether millstone of the Protestant federation."

That sounds like Cassandra. We rather predict that the Episcopal Church will enter heartily into federation with the other denominations, and be ground between no millstones.

Two Convictions

During the last week two trials of no little interest have concluded with the verdict of guilty. One was that of Captain Thain, charged with the killing of

Mr. Annis. It was a compromise verdict, for he was either guilty of murder in the first degree, as the evidence seemed to show, or was insane and innocent. But the jurors who at first were ready to declare him innocent were themselves infected by the mischievous virus of the unwritten law, and they were willing to give up the pretense of insanity, which was shrewdly worked by the defense, if only he was not to receive the death penalty. The evidence seemed to bring out plainly enough Mr. Annis's illicit relations, and in some sections of the country the captain would have been immediately acquitted, but the jury represented a more civilized standard and deserve warm approval. The other trial is that of the nightriders in Waverly, Tenn. They had brutally beaten a man for the offense of criticising the nightriding amusement; they were convicted and sentenced to the very moderate penalty of ten days of imprisonment and \$500 fine. They laugh at it and had a congratulatory supper together. Well, that is better than acquittal. Perhaps we ought to be pleased that any punishment at all was inflicted.

Interparliamentary Union Progress

The Interparliamentary Union has at last decided to open permanent offices and employ an official secretary. Only a few weeks ago plans were perfected to this end, and as soon as the Peace Palace at The Hague is completed, the Union will make its headquarters within it. Some of those who look ahead to the coming of the Parliament of Man expect the Interparliamentary Union to be the nucleus of the lower house of "The United Nations," deriving as it does its membership from the people of the world; and the Hague Conference the nucleus of the upper house, as it is appointed by the world's sovereigns. But the question of whether the world parliament will be bi-cameral or not is a trifle academic for the present, and can safely be left to the future. The thing to be noted is that the legislative branches of the governments have followed the example of the executive branches and chosen The Hague for their capital.

The Calculation of Dividends on Life Insurance Policies

UNDER Chapter 326, Section 83, of the Laws of the State of New York, every domestic life insurance corporation must distribute the surplus accruing on all policies issued after December 31st, 1906, annually, and not otherwise.

It is therefore an easy matter for policyholders to watch the dividends accruing on their policies from year to year, and accordingly a concise explanation of the method of calculation of these dividends may interest our readers.

What is called the "contribution system" is now in general use by American companies, according to which the dividend is made up of three parts: (1) the portion of the loading (the excess of the office premium over the net mathematical premium) not needed for expenses; (2) the interest profit, *i. e.*, the excess of the interest actually earned on the reserve held against the policy over that required to maintain the legal reserve; (3) the mortality profit, due to the fact that the claims by death were less than those expected under the mortality table used.

Dissatisfaction is sometimes expressed by policyholders who do not understand why dividends drop after a time under a limited payment life or endowment policy; for instance, under a twenty-payment life policy the dividend payable twenty-one years after the policy was issued is usually considerably less than that of the preceding year. This is due to the first portion of the dividend being absent, as each dividend is based on the experience of the policy year just closing, and no premium was payable at the beginning of that year.

The Vacant Equitable Trusteeship

IN our issue of February 6th, 1908, we called attention to the Equitable Life Assurance Society and its stock control which rested in the hands of certain trustees, of whom the late Grover Cleveland was one. As yet no successor has been chosen to Mr. Cleveland, under the

terms of the trust agreement executed on June 15th, 1905. At the time of his death, on June 24th last, Mr. Cleveland was chairman of these trustees and a considerable amount of interest has subsequently been manifested in the selection of his successor. Under the terms of the trust agreement the surviving trustees are empowered to fill any vacancies in the board. Unless the trust agreement is continued, for which provision is made in the instrument, it will terminate on June 15th, 1910. The surviving trustees are ex-Justice Morgan J. O'Brien and George Westinghouse, who exercise voting power over 502 shares of Equitable Life stock. The name of ex-President Roosevelt has been suggested as a fitting successor to Mr. Cleveland. THE INDEPENDENT took the ground in its issue of February 6th, 1908, that the Equitable stock having been pledged to the mutualization of that company, it should be accomplished. The reason advanced at that time was that the title to the entire property would then be vested in the policyholders, who could then at will change their trustees and officers, just as was done some years ago by an important Philadelphia company and later by one of the large New York mutuals. The reasons which existed at that time for mutualization are no less potent today than they were then, and it is to be hoped that the mutualization of the Equitable will speedily be accomplished and made absolute instead of approximate.

DARWIN P. KINGSLEY was re-elected president of the New York Life Insurance Company last week. In his speech of acceptance he said that the insurance laws, both in letter and spirit, had been carefully observed by his company. He incidentally pointed out that the State of New York is curbing the New York Life's legitimate activities. Unhampered by Section 96, which limits the amount of new business to \$150,000,000, Mr. Kingsley stated that his company could and would in the current year have produced \$175,000,000 new business within the cost named by the State in its 1906 statute.

Conditions and the Prospect

THERE were signs, last week of steady improvement in the condition of great industries, and the utterances of men who are recognized authorities in commerce and finance were distinctly optimistic. As a rule, the building record is a trustworthy measure of public confidence. Figures for April and for the first four months of the present year are impressive and most encouraging. Reports for April from one hundred leading and representative cities (published by *Bradstreet's*) show a gain of 44.9 per cent. over April of last year. In preceding months, however, the advance was even greater—March, 83.3 per cent.; February, 94.4; January, 94. When the four months are taken together, an increase of 73 per cent. over the corresponding period of last year is shown. Those who are familiar with conditions which determine investment in new construction see the meaning of this.

In the iron and steel trade there is an upward movement in prices, with a growth of output. The work of the Steel Corporation has now risen to 70 per cent. of its full capacity, the highest percentage since October, 1907. A larger proportion is reported by two or three independent companies, 80 per cent. by the Lackawanna, and 75 by the Republic. Record-breaking orders are said to have been received by the American Steel and Wire Company during the last two weeks. Gains are shown by the great electric manufacturing concerns. Large orders for railway equipment were given last week, and inquiries for much more are pending. President Corey, of the Steel Corporation, points to "a well-sustained improvement," saying it is "due to a natural and healthy demand." Judge Gary, chairman of the Corporation's board, said last week:

"The clouds are lifting, the mists are clearing away, and we shall soon see that, after all, the use of money is shining as brightly as ever."

In the past much weight has justly been given to the estimates, warnings, and predictions of Frank A. Vanderlip,

now president of the great National City Bank. Last Saturday night, in Cincinnati, he expressed his conviction that the country was on the verge of a period of great prosperity, and that marked improvement would follow the signing of the new tariff bill. James J. Hill, of the Great Northern Railroad, finds the "outlook good in all directions," altho the wheat crop promises to be only a fair one. An increase of acreage in the spring wheat States is reported. Seeding there is nearly completed. Mr. Hill longs for an end of tariff agitation. "Then," he says, "things will begin to hum." Secretary MacVeagh said last week in his address to the bankers of New York: "With the completion of a tariff bill satisfactory to the people, there is nothing in sight but a reasonable prosperity."

....Enormous deposits of coal have recently been discovered in the mountains along the boundary between British Columbia and Alberta. This newly found coal field is said to be the largest in western North America.

....Governor Hughes has signed the bill designed to prevent further delay in the payment of special franchise taxes by public service corporations in New York. The amount due and unpaid is about \$41,000,000.

....The Pennsylvania Railroad Company is planning to set out this spring more than 1,000,000 young trees. This will make a total of 3,430,000 planted in three years to provide in part for the company's future requirements in timber and cross ties.

....Attorney General Wickersham has decided that "it is a matter for the discretion of the directors and officers of a national bank to determine whether they will enter into a contract with an insurance company guaranteeing the bank's solvency." This decision is not in conflict, however, with an earlier one that such a bank cannot comply with the requirements of a State law for guaranteeing deposits.

Survey of the World

Mr. Taft's Speeches in the South

President Taft went to Petersburg, Va., on the 19th, to be present at the unveiling of a monument erected at Fort Mahone, on the Petersburg battlefield, in memory of General Hartranft and of the Pennsylvania volunteers who fell there. Among those who took part in the ceremony were a daughter of General Hartranft and the widow and a daughter of General William Mahone, the Confederate soldier. Mr. Taft was warmly welcomed. Veterans in blue and veterans in gray were present. In the course of his address the President said:

"In the time which has past the bitterness of the internecine struggle has past away, and we now treasure as a common heritage of the country the bravery and the valor of both sides in that controversy. The Army of the Potomac, under Grant and Meade, was seconded and supported by a generous Government. It was hardly so with the Confederate forces. Scantly clothed, rarely on more than half rations, and for considerable periods reduced to an allowance of bacon and meal hardly sufficient to sustain life, the long winter thru, their shivering infantry manned the ever-extending siege works, and made head against the vigorous assaults of the Union army until their depleted ranks were no longer equal to the defense of their attenuated lines, and they gave up a contest which by any other soldiers but the tried and seasoned veterans of the Army of Northern Virginia would long before have been abandoned. Pennsylvania's pride must be in the victory achieved by her men against so brave, resolute, and resourceful an enemy. That we can come here today and in the presence of thousands and tens of thousands of the survivors of the gallant Army of Northern Virginia and of their descendants establish such an enduring monument by their hospitable welcome and acclaim, is conclusive proof of the uniting of the sections and a universal confession that all that was done was well done, that the battle had to be fought, that the sections had to be tried, but that in the

end the result has inured to the common benefit of all."

He spoke also at an outdoor luncheon given in his honor. The Spanish War, he said, more than any other event had made us a united country, but wars were expensive in money and blood. We should cultivate virtues less heroic or spectacular than those of the warrior, cultivate an unselfish desire to promote the public weal every day and every week. Turning to the tariff, he remarked that if a man in Alabama wanted \$2 on lumber for revenue, and a man in Washington wanted \$2 on lumber for protection, there was little room for dispute between them as to the size of the duty. He was not in favor of \$2 on lumber, "but we are working together by different roads." We were going to have ultimately two great parties, a nucleus for each in every State, to hold the other in condition to do business properly.—Late that evening he left Petersburg for Charlotte, N. C., where, on the 20th, he took part in the celebration to commemorate the Mecklenburg Declaration of Independence. In his address there he spoke for tolerance of political opinion, which should promote the building up of respectable parties on both sides of the line, because a good Opposition was essential to good government. Of course, he continued, he desired that the Republican party in North Carolina should be strong enough to make a good fight at every election. Some thought he had lost sight of that party when he appointed to office a Democratic lawyer "of the highest eminence, learning and integrity":

"I promised after I was President-elect not before the election to the South that I would

do the best I could to wipe out the feeling that the central Government at Washington was a Government alien to the Southland, and pointed out that the only way by which the Executive could cure that feeling was, in so far as in him lay, to put into office men in whom the community at large, without regard to party, would have the highest confidence. Now I am trying to do that."

Having pointed out that President Harrison had deemed it his duty to put one Democrat on the Supreme Bench and two on Circuit Courts of Appeals, he said:

"The Federal judiciary, my dear friends, to my mind is the strongest bulwark that we have in all this country to protect ultimately our institutions of civil liberty. These are the things in the Federal Constitution that we must love and must hug to our bosom if we continue this civilization, and therefore there is no more sacred duty that the Executive has than in the selection of men whose appointment and service on the bench will strengthen it with all the people at large, and therefore ordinary considerations of political partisanship have much less application to the appointment of judges than they do to other and temporary offices."

If he should have an opportunity to make appointments to the bench in the South, it would continue to be his duty to make such appointments as would commend themselves to all the people, Republicans or Democrats, appointments of such a character that the use of them in partisan argument would be discouraged. He had not dreamed, he said in conclusion, that there was to be a political revolution in the South:

"But I do believe we are on the eve of such a condition in the South that there shall be complete tolerance of opinion, and that there shall grow into respectable power an Opposition in each State which will tend to the betterment of the government of the State, and which will give us occasionally, as you have given us in North Carolina, a Republican in a crowd of Democrats, in order that we may have represented at Washington your views, without regard to some past issue, without regard to the ghost of an issue that really ought not to influence you in enforcing those particular economic views which you really entertain."

✽

The Senate Little progress was made
Tariff Debate last week during the de-
bate in the Senate upon
the pending tariff bill. Altho some speci-
fied paragraph of the measure was al-
ways before the Senate for action, many
of the speeches covered a wide range.
Whenever votes were taken upon the op-
inions of those who were not in agreement

with the committee, it was evident that Mr. Aldrich could command all the support he needed. The number of Republican insurgents was not increased, and occasionally certain Democrats showed a preference for protection. One of them was Mr. Daniel, of Virginia, who spoke for the protection of the manufacturers of quebracho, an extract of chestnut bark used in tanning. There are nine quebracho factories in his State. At the same time the maintenance of the protective duty on this product was opposed by another Democrat, Mr. Smith, of South Carolina, upon the ground that the industry was ruining the chestnut forests. On the 20th, Mr. Tillman complained that the critics were wasting time. He urged Mr. Aldrich and his associates in the majority to take measures for checking the flow of speeches and for hastening final action. Two days later Mr. Aldrich asked that a date for the final vote be fixed by unanimous consent, but Mr. Daniel (Democrat) and Mr. Cummins (Republican) objected. On the 18th it was asserted, apparently upon good authority, that the Democrats and the Republican insurgents had reached an agreement for united action in support of an income tax amendment, and that a bare majority for such an amendment was assured. The provisions of the bill (a compromise) which had been accepted were published. But on the 21st there was an equally authoritative announcement that this combination had been dissolved. There was no longer any hope, it was said, of the passage of such an amendment. It was understood that a provision for an income tax would be proposed in several forms, all of which, it was predicted, would be referred to the Finance Committee, with instructions that a report be made in December.

✽

The San Francisco Bribery Cases

During the trial last week of Patrick Calhoun, president of the street railroad company in San Francisco, for bribery, one of the witnesses was Rudolph Spreckels, who has given much money for the support of the bribery prosecutions. Mr. Heney said he had summoned Mr. Spreckels because of the insinuations and assertions that the

latter had had a selfish purpose, seeking to obtain control of the railroad company. The witness gave a long account of his relations with Calhoun, speaking of his efforts in behalf of the city and for the protection of his own property, to prevent the introduction of the overhead trolley. Ruef, he said, had asked him to organize a syndicate to bid for an issue of city bonds, offering, if he would do this, to have a strike called on the street railroads and to cause so much disturbance that no one else would care to bid. He showed that the subscriptions for carrying on the prosecutions amounted to \$213,391, of which he had contributed \$138,478. To Detective Burns had been paid \$123,250, mostly for the expenses of Burns and his agents. The witness had paid between \$500 and \$600 a month to Prosecutor Heney for about three years. Heney, at the beginning, had volunteered to work without pay. Interesting testimony was given by John Helms, a detective formerly employed by Calhoun to follow Burns. In November last this man entered the service of Burns, and for a time was paid by both sides. He testified that Mr. Abbott, the railroad company's general counsel, hired Burns's secretary (Platt) at \$200 a month to take copies of Burns's private papers, Helms paid the money to Platt. He had heard Abbott say he wished some one would shoot Heney.—John H. Sanderson, one of the men found guilty of defrauding the State of Pennsylvania in supplying furniture for the new Capitol at Harrisburg, died suddenly a few days ago in New York. It was estimated that the profits on his contracts exceeded \$4,000,000. He had been sentenced to be imprisoned two years, and was out on bail, pending action upon an appeal. Since the Capitol frauds were exposed, four persons convicted or accused have died.

✱

Our Pacific Islands

Just before the final adjournment of the Philippine Assembly, on the 20th, Speaker Osmena offered a resolution instructing the Philippine delegates at Washington to work for a grant of immediate independence to the islands. The resolution was adopted without dissent, all the Nationalists voting for it.

while the Progressives (minority party) were permitted, at their own request, to refrain from voting. Altho the session was a stormy one, Acting Governor-General Forbes reports that the Assembly was in harmony with the Commission and the insular Government. A railway guaranty bill was past which insures an extension of the existing Luzon railroad system to the extreme southern part of the island. At the laying of the cornerstone of the new Capitol, in Manila, on the 21st, Speaker Osmena expressed a belief that the building in years to come would be the seat of free and independent government for the Filipinos. Governor Forbes in his address said that independence was not to be lightly spoken of, but was a goal to be attained by work and by proving that the worth of the people warranted a grant of self-government.—In Hawaii 6,000 Japanese laborers who have been employed by the planters are on strike. About 2,000 men have been hired to work in their places, and the planters are trying to obtain laborers in Porto Rico, offering to each one \$35 a month, free passage, and a house to live in.

✱

Central and South America

Nicaragua's Special Commissioner, Señor Gonzales, empowered to make plans for a settlement of the Emery claim, has arrived in Washington and been formally received by President Taft, who spoke of "the equitable and kindly disposition of the United States toward Nicaragua," which, "coupled with mutual trust, sincerity and regard for justice, is the only sure ground of continued relations." On the day of this reception a newspaper which is regarded as the organ of President Zelaya arrived in Washington, and it contained an editorial bitterly attacking the United States, denouncing Salvador and Honduras for entertaining United States naval officers and urging that Nicaragua should seek an alliance with Japan by offering her the right to build an interoceanic canal. But Zelaya gave a ball and a banquet last week in honor of the officers of the cruiser "Albany," and at the banquet proposed the health of President Taft.—A court in Venezuela has decided that ex-President Castro must pay rent

(with damages) for his six years' occupation of the Miraflores Palace, which is the property of Señora Crespo. The dispatches say that the judgment calls for several hundred thousand dollars. In answer to a petition from the Attorney-General, the courts have dismissed the charge against him of complicity in the plot for the assassination of President Gomez. This was done because all the other persons accused in connection with this plot have been set at liberty by a decree of amnesty. Castro's brother, Celestino, has been expelled from Curacao, where he was awaiting permission to return to Venezuela.—Villareal, Magon and Rivera, Mexican revolutionists, have been convicted in Arizona of violating the neutrality laws, and have been sentenced to be imprisoned for eighteen months. It was alleged that they plotted last year's uprising in Northern Mexico.—By direction of President Taft, and at the suggestion of the President of Peru, it has been ordered that the Pacific entrance of the Panama Canal, heretofore known as La Boca, shall hereafter be called Balboa, "in honor of the discoverer of the Pacific Ocean."

European Financial Measures

The budget provisions for new sources of revenue are being past in the House of Commons with an average vote of about 300 to 123. The clauses already past are those providing for new death duties, settlement duties, legacy and succession duties, and an automobile tax. Mr. Balfour, in speaking for the Opposition, said:

"Let us be careful that we do not associate democracy with robbery, an association which has never been true of any civilized modern State and which, I hope, will never be true of this country; but it seems nearer after this budget than ever before."

Premier Asquith announced, in a speech at Sheffield, that the Government proposed to establish not only old age pensions and insurance against unemployment, but some form of state insurance for sick and infirm workers.—There was reason in Mr. Asquith's question, "To what country will it fly?" when in the course of the budget discussion the Opposition expressed the fear that

capital would fly the country on the imposition of the new taxes, for other European nations are likely to go as fast or faster than England in placing heavier burdens upon the richer classes. A progressive inheritance tax has been introduced into the Russian Duma by the Finance Committee. It provides for an imposition of one-half to two-thirds of one per cent. upon all bequests, depending upon the kinship and the amount. The new Austrian budget submitted by the Minister of Finance to the Reichsrat provides for an increase in the income tax and a special tax on bachelors, widowers and childless husbands. In Germany the financial proposals of the Government are still opposed by the Reichstag. Instead of the inheritance tax and increased death duties advocated by Chancellor Von Bülow, the Conservatives propose to tax the accrued value of real estate between one sale and another a system which very much resembles Premier Asquith's taxation of the unearned increment.

The Military Movement in England

The naval program which was proposed by the Government and approved by the majority in Parliament provided for the construction of four new battleships of the "Dreadnought" type and authorized the Government to construct four more if it was deemed necessary. Since then the public agitation in the country over the possibility of an invasion has apparently influenced the Cabinet, and it is announced that the four optional "Dreadnoughts" will be started before the end of the fiscal year, bringing the total number up to eight, as demanded by the Opposition. Two of the new vessels are to be built in private yards and two by the Government. They are to be fitted with turbines giving a speed of 21 knots an hour and are officially announced to be at least 30 per cent. superior in fighting capacity to the "Dreadnoughts" previously constructed. Admiral Lord Charles Beresford, in a speech at the Australasian banquet, deplored the effect produced on naval construction thruout the world by British boasting over their first "Dreadnoughts." He said:

"We have told other nations, particularly a neighboring nation, that that ship could sink the whole of her fleet. Was that an agreeable sentence? It was stupid.

"What is the result? All the other nations are now building Dreadnoughts, and we have got to keep on building, spending some £50,000,000 more, I believe, than need have been spent because of uttering that insane advertisement.

"If things go on as they are going now it will in the near future be impossible for us alone to maintain a two-Power standard, but it will be easily maintained if we have an imperial navy."

He recommended that each of the colonies construct cruisers for the defense of its own trade instead of contributing toward the building of a battleship. The English papers are full of rumors of airships which have been reported to have been seen in various parts of the country, mostly at night, and are assumed to be the scouts of the German aerial navy spying out the land preparatory to an invasion.—Field Marshal Earl Roberts, in the House of Lords, declared that the British army is a sham, and denounced the Government for not appealing to the people to make it efficient, saying:

"I know perfectly well that the leaders in both houses are anxious about the future, but they do not tell the country that we have neither an army to send abroad nor to defend the country at home. While we are sitting here, taking it easily and comfortably, the danger is coming nearer and nearer to us daily, and unless you cease telling the people they are living in safety and get an army fit to deal with any enemy we shall one day come to such utter grief that you will bitterly regret your inaction."

French Labor Troubles

The object of the postal employees in organizing a militant union contrary to law was for the purpose of affiliating with the General Federation of Labor and securing its support in their strikes. Enthusiastic mass meetings had been held in the Hippodrome at which Government employees in uniform fraternized with the labor unionists and the leaders of the Federation encouraged them in their opposition to the Government, but last week, when the matter came to a test, the various unions of the Federation failed to come to the rescue of the postmen. A general strike was ordered on May 10th, but there was lit-

tle response either on the part of the workmen or of the postal employees who had returned to work, so two days later the strike was formally called off. Three or four hundred of the employees of the Post Office Department are still holding out, but most of these have been discharged. The leaders of the Federation were divided on the question of supporting the postal employees; the more violent of them declaring that the 1793 of the workmen was at hand. M. Pataud, leader of the Electricians' Union, urged the overthrow of the existing régime, threatened to plunge Paris in darkness as he had done twice before, but Secretary Niel, of the General Federation of Labor, frankly stated that in his opinion the proletariat was not yet sufficiently educated successfully to conduct its own battles. On May 20th, Ascension Day, there was, as usual, a general cessation of labor, and 15,000 workmen, ostensibly strikers, assembled in St. Paul's Riding School. As they dispersed they came into conflict with the police and eight of them and twenty-three of the policemen were injured. The principal weapons used by the navvies were chairs, bottles and siphons from a neighboring café, the last proving very efficient substitutes for bombs. On the 23d, the anniversary of the shooting of the Communists of 1871, a demonstration was made in their honor in the Père Lachaise Cemetery. A large force of police and soldiers was at hand and no disorder of importance occurred.—The battleship "Danton," which was to be launched at Brest on May 22d, was stuck in the ways, where it still remains, in danger from a collapse of the supporting structure. It is suspected that this is a case of sabotage or intentional injury done by the workmen, for many of them are anarchists and have openly boasted that the battleship would never be launched.—In the provinces as well as in Paris there have been numerous cases of the cutting of telegraph wires and the destruction of letters in the boxes by pouring in destructive fluids.—The Government has prepared a bill defining the rights of State employees establishing a double system of promotion by merit and by seniority, and permitting them to form associations for mutual

benefit and professional purposes, but not militant trades unions.—After a dinner given by the Royalist Committee of Paris in honor of the Duke of Orleans a week ago last Sunday, the cry of "Vive le roi" was raised on the street. The fifteen Royalists who were then arrested were sentenced on the 18th to imprisonment for two months.—The Parliamentary Committee appointed to investigate the falling off of skilled workmen has reported that the cause is the decline of the old apprenticeship system, and the failure of the modern industrial schools to take its place as a system of training of young people in the useful arts. They recommended the following measures: (1) That it be made compulsory for all young persons of both sexes under eighteen years of age, who may be employed either in commerce or industry, to attend courses of technical instruction ("cours de perfectionnement"). (2) These courses are to take place in the daytime, upon days and at hours determined for each locality by committees composed of representatives of the municipal authorities, the associations of manufacturers, and of the working people. The selection of the dates and hours is to be made in such a way as to accord best with the respective interests of the manufacturers and the educational requirements; employers will be bound to enable their working people to set apart sufficient time to attend the classes. (3) The course of instruction is to be adapted in each district to the requirements of the local trades, and is to be so chosen as to train up skilful workers and competent assistants, thoroly versed in the technical knowledge of their respective occupations.

A Decision of The Hague Court The Hague Court of Arbitration has adjudicated the case of deserters at Casablanca, Morocco, which at one time threatened to cause serious conflict between France and Germany. Some deserters from the French Foreign Legion took refuge in the German Consulate at Casablanca and the secretary of the Consulate signed a safe conduct for their removal to a German steamship. Only three of the deserters were

German. The French soldiers and sailors sent out to arrest the deserters invaded the German Consulate and seized them, drawing their revolvers against the consular agents and roughly handling the Moroccan guards. The Court of Arbitration holds that the German Consul had no right to protect the deserters, even those of German nationality, but on the other hand reproves the French authorities for their use of force in the invasion of the Consulate. The deserters will now be tried by court-martial in the ordinary way.

South African Union

The movement for a close union of the four South African States has successfully past a second critical stage, that is, the revision of the constitution drafted in the Durban convention in accordance with the amendments proposed in the various parliaments. The second constitutional convention met at Bloemfontein on May 3d, and at noon on May 14th the revised constitution was signed by the delegates. Altho the differences of opinion were decided and strongly felt yet the same friendliness and determination to carry thru the project prevailed and by a few compromises and agreements was reached. The Transvaal Parliament refused to jeopardize the Union by making any amendments and in this convention as in the first the Dutch delegates under General Botha and Mr. Smut worked in perfect accord with their political opponents, Sir George Farrer and Sir Percy FitzPatrick. The Orange River Colony also approved of the first draft with two minor amendments. The Natal delegates were instructed to work for eleven amendments, mostly for the purpose of safeguarding the "State rights" of this, the smallest of the future provinces. The Cape Parliament sent in the same number of amendments in the interests of the Afrikander Bond, representing the Boer farming population of the Colony. The original draft, in order to prevent gerrymandering, placed the limit of the variation in population between the different electoral districts at 15 per cent. The Bond demanded that this be raised and that the country districts be given a 30

per cent. advantage in representation over the urban districts. This was resisted by the Bloemfontein Convention, but the matter was compromised by the abolition of proportional representation in the elections to the Assembly. This will increase the power of the Boer vote in Cape Colony as well as elsewhere by excluding the British minority in the country districts from representation. But in the elections for the Senators and for the Executive Committees of the Provincial Councils the principle of proportional representation was retained. Another demand of the Cape was acceded to in striking out the words "of European descent" from the clause "all persons of European descent naturalized in any of the Colonies shall be deemed to be naturalized thruout the Union." This secures the rights of the negro population who alone in Cape Colony can become citizens. A new clause provides that any new changes in the basis of representation shall require the Royal Assent. Free trade prevails thruout the Union. The inequality of representation complained of by the Cape Colony was not remedied. Instead of fifty-eight members of the Assembly to which its adult white population would entitle it, the Cape will have only fifty-one. The Orange River State province will have seventeen instead of the fourteen to which it is entitled. Natal will have seventeen, and the Transvaal will have thirty-six. The constitution as revised now goes back to the four parliaments for approval, and in Natal will also be submitted to referendum. Then if past by them a delegation headed by General Botha will go with it to London to receive the approval of Parliament. This delegation is empowered to accept any minor changes that the Imperial Government may insist upon. Except for the amendments here specified and some others of less importance the constitution, of which we gave a full abstract in our issue of February 25th, remains unchanged.

Foreign Notes

Mohammed V, Sultan of Turkey, in his first speech from the throne before the Chamber of Deputies, May 20th, deplored the Adana

massacres, and exprest his determination to punish the guilty. Reports from that region do not, however, indicate much alleviation of the suffering. The Turkish troops do not protect the Armenians in the harvesting and cultivation of their crops, and influential Mohammedans refuse to return the Armenian girls whom they have obtained in the recent riots. —The Shah of Persia has succumbed to the pressure brought upon him by the Russian and British ambassadors at Teheran and has re-established constitutional government. A proclamation of amnesty has been published and the royalist troops will be disbanded. Said-ed-Dowleh, recently dismissed from the office of Foreign Minister, has been requested by the Shah to form a Liberal Cabinet, the head of which will be Nasir el Mulk, who was Premier in 1907, but is now a refugee in Europe. A new electoral law is being framed by the Council of the Empire, to which thirty Constitutionalists have been added. The Russian troops under General Snarsky, occupying Tiflis, have been reinforced by 2,000 infantry and two companies of sappers. It is proposed to extend the Russian occupation to Urimia, where the foreign residents, including British and American missionaries, are said to be in need of protection. —Prince Ito, Japanese Resident-General in Korea, has returned to Japan, and Viscount Sone, Vice-Resident-General, will be appointed to his place. It is supposed that Prince Ito will succeed Prince Yamagata at the head of the Japanese Government, but the reason of this sudden change is not known. China and Russia have come to an agreement in regard to the government at Harbin and other commercial towns on the Russian railroad in Manchuria. The principles of Chinese sovereignty and open door are specifically acknowledged, and both Chinese and foreigners are eligible for election to the municipal assemblies which are to be organized. The Chinese President of the Board of Foreign Affairs, the Manchurian Viceroy and the Russian director of the Chinese Eastern Railway are given supervisory power, with a veto upon the acts of the assemblies, but the assemblies have power to override the veto by a threefold vote.

THE MICHIGAN
LAW REVIEW

The Michigan Daily

UNIVERSITY *of* MICHIGAN

by EDWIN E. SLOSSON

THE essential difference between a State university and other universities is that the former is part of a public school system. The source of the income is of less importance, and there is not so much difference in the composition of the student body as is generally supposed, for even endowed universities of widest reputation have a local constituency and draw a large majority of collegiate students from a surrounding area no larger than a Western State. But if all the young men in Connecticut boycotted Yale, that university would not be materially altered, while if a State university were dissevered from the State administration and school system, it would lose its distinctive characteristics. Therefore, all direct comparisons between an endowed university and a State university are improper and misleading, unless the fact that the latter is not an independent entity, but an organ, is taken into consideration. A book written on the physiology of the human head without reference to the body which nourishes and supports it and which it largely controls, would have very little value. It is because, in Michigan, this system was first completely developed that the University has stood for more than a half century as the typical and leading State university.

The germ of this idea is found in the Act of 1817, establishing the Catholepistemiad of Michigania. Judge A. B. Woodward, of the Supreme Court of the Territory, friend and appointee of Thomas Jefferson, devised the plan of the university and its terminology. One page of the historic document in his handwriting, preserved in the university library, reads as follows:

A TABLE OF THE PROFESSORSHIPS OF A UNIVERSITY CONSTRUCTED ON THE PRINCIPLES OF THE EPISTEMIC SYSTEM.

I.		II.	
The various faculties and departments of the University		The various names which may be employed to designate the various departments of the University	
I	Language	I	Anthropoglossica
II	Mathematics	II	Mathematica
III	Natural History	III	Physiognostica
IV	Natural Philosophy	IV	Physica
V	Astronomy	V	Astronomica
VI	Chemistry	VI	Chymica
VII	The Medical Sciences	VII	Iatrica
VIII	The Economic Sciences	VIII	Oeconomica
IX	The Ethical Sciences	IX	Ethica
X	The Military Sciences	X	Polemitactica
XI	The Historical Sciences	XI	Historica
XII	The Intellectual Sciences	XII	Ennceica
XIII	Universal Science	XIII	Catholepistemiad

In some respects it is a pity that this nomenclature was allowed to lapse. It would have afforded splendid material for college yells. When the students of the Epistemiim of Iatrica rushed the boys coming from the lecture rooms of the Didactorim of Anthropoglossica, then would have come the tug of war.

The first faculty consisted of two men—the Rev. John Monteith, from Princeton, who held the presidency and seven

President of the University of Michigan

GREAT AMERICAN UNIVERSITIES.—This is the sixth of a series of articles on the present condition and future prospects of the great universities of the United States by one of the editors of THE INDEPENDENT. The dates of publication of these articles are as follows:

1 Harvard University.....	Jan. 7th, 1909	8 University of Minnesota....	Aug. 5th, 1909
2 Yale University.....	Feb. 4th, 1909	9 University of Illinois.....	Sept. 2d, 1909
3 Princeton University.....	March 4th, 1909	10 Cornell University.....	Oct. 7th, 1909
4 Stanford University.....	April 1st, 1909	11 University of Pennsylvania...	Nov. 4th, 1909
5 University of California.....	May 6th, 1909	12 Johns Hopkins University...	Dec. 2d, 1909
6 University of Michigan.....	May 27th, 1909	13 University of Chicago.....	Jan. 6th, 1910
7 University of Wisconsin.....	July 1st, 1909	14 Columbia University.....	Feb. 2d, 1910

of the Didaxiim, and Father Gabriel Richard, who held the vice-presidency and the remaining six, a careful balancing of the rival factions of the young territory, Catholic and Protestant, French and English. Special taxes and lotteries were authorized for the support of the institution, tho the latter were never employed.

But the important thing about the Act of 1817 was that it founded not merely a university, but a complete public school system. The university was empowered to establish libraries, colleges and schools in the counties and towns of Michigan and to appoint their "Instructors and Instructrixes."

The Catholepistemiad scheme was of French origin. It bears the stamp of the constructive genius of Napoleon. The next impulse also came from France, tho originating in Germany, and it was

fortunately in the same direction. A copy of M. Victor Cousin's Report on the State of Public Instruction in Prussia fell into the hands of the Chairman of the Committee on Education of the Convention of 1835, which framed the Constitution. So a school system on the Prussian model came into existence simultaneously with the State government, and as its head the university was established at Ann Arbor, with "branches" in many parts of the State. The branches, however, were soon lopped off and the university became of the conventional type of the New England college.

The third great formative influence came direct from Germany. Henry P. Tappan, Professor of Moral and Mental Philosophy in the University of the City of New York, had gone to Germany to study the educational system there, and returning he chose the presidency of the little institution in the backwoods of Michigan rather than his former professorship, because he believed that "a university in the proper sense could be built up only as an inseparable part and a living member of a system of public instruction," and that the conditions essential to its development could not be found in the East.

The instantaneous transformation of the college into the university effected by President Tappan can be seen by a glance at a file of catalogs. The catalog of 1851-52 looks like a valentine, fancy gilt print on shiny white paper; a faculty of six, the traditional prescribed course, and a "Catalogus Senatus Academici et eorum Qui Munera et Officia Gesserunt"; commonplace, conventional, self-satisfied, unambitious, unimaginative. The catalog of 1852-53 is a business-like pamphlet in brown, with fourteen names in the faculty list, and, what is even more significant, five unfilled professorships. President Tappan's genius is shown in the way he advertised the deficiencies of the institution. He headed his roll, "Undergraduate Students." There were no graduate students, but he wanted it understood that there ought to be. It was six years before the first resident graduate student was proudly listed, James C. Watson, in astronomy, one

THE NUMBER OF STUDENTS IN THE VARIOUS DEPARTMENTS OF THE UNIVERSITY OF MICHIGAN, 1817-1874.

of Dr. Tappan's first acts being to secure, thru the generosity of citizens of Detroit, an observatory with a telescope of 13-inch objective. He introduced lecture and laboratory methods of instruction, adopted the principles of election and equivalence of studies, admitted new scientific and technical courses, added departments of medicine, engineering, agriculture and law, and planned for other such professional schools, all to be ultimately based upon four years of collegiate work, which he anticipated would be done mostly in secondary schools scattered thruout the State. In accordance with Prussian ideals, he abolished dormitories, and made no attempt to regulate the private life of the students, at the same time resenting the attempts made by an officious public to regulate his. He insisted that money should be put into apparatus and books instead of fine buildings, and he had no use for honors and grades. He welcomed the short term and irregular student who came for some special thing and went away when he got it.

I am devoting an unusual amount of space to the history of the University of Michigan, partly because it is little known to general readers and partly because it enters into the history of all the Western State universities and other institutions as well. As Charles Kendall Adams said in 1896:

"One of the normal methods of advance seems to be for the University of Michigan to devise some new educational variation, or return to some old European standard, and then,

DISTRIBUTION OF STUDENTS AT THE UNIVERSITY OF MICHIGAN, 1897-98.

after it has demonstrated its success, pass it thru Harvard, as civilization is passed thru France. It can then be proclaimed as the ripe fruit of the oldest and most renowned of American universities."

The first Tappan catalog marks an era in American educational history. It lays down the main lines of the development of the State university, not only up to the present, but into the future. The Association of State Universities at its last convention tried to do what Dr. Tappan wanted done, to draw a clear distinction between the university and the college, to require collegiate preparation for professional work, and to insist upon graduate work as an essential to a university. The relegation of part of

*After deducting names of students counted twice.

the undergraduate work to high schools and subsidiary colleges is another Tappan idea which seems likely to be realized within the next decade.

In his inaugural in 1852 President Tappan said: "We are a university faculty giving instruction in a college or gymnasium." The same could be said now by the presidents of four-fifths of the institutions in the United States calling themselves universities, but they are not much given to saying it. The Tappan catalogs were ambitious and imaginative, but they were not exaggerative. During the ten years of his administration he kept standing in the catalog this statement of policy:

"But the regents and faculty cannot forget that a system of public instruction can never be complete without the highest form of education, any more than without that primary education which is the natural and necessary introduction to the whole. The undergraduate course, after all that can be done to perfect it, is still limited to a certain terms of years, and, necessarily, embraces only a limited range of studies. After this must come professional studies, and those more extended studies in science, literature and the arts, which alone can lead to profound and finished scholarship. A system of education established on the Prussian principles of education cannot discard that which forms the culmination of the whole. An institution cannot deserve the name of a university which does not aim, in all the material of learning, in the professorships which it establishes, and in the whole scope of its provisions, to make it possible for every student to study what he pleases and to any extent he pleases. Nor can it be regarded as consistent with the spirit of a free country to deny to its citizens the possibilities of the highest knowledge.

"It is proposed, therefore, at as early a day as practicable, to open courses of lectures for those who have graduated at this or other institutions, and for those who in other ways have made such preparation as may enable them to attend upon them with advantage. These lectures, in accordance with the educational systems of Germany and France, will form the proper development of the university, in distinction from the college or gymnasium now in operation.

"Such a scheme will require the erection of an observatory, a large increase of our library and our philosophical apparatus, and additional professors. A great work, it will require great means; but when once accomplished, it will constitute the glory of our State and give us an indisputable pre-eminence."

It is strange that a professor of mental philosophy and an experienced educator should have so grievously underestimated the power of overboldness of

faculty and regents. President Tappan was summarily and ungratefully dismissed in 1863, and it was not until 1893 that the Graduate School was formally organized, and it does not yet contain the twenty departments he outlined. After his dismissal the heading "Undergraduate Students" was dropt from the catalog, together with all his other hints that the university was an unfinished pyramid like that on the great seal of the United States.

The Regents elected the Rev. Dr. E. O. Haven president of the university at the same meeting that they declared the removal of Dr. Tappan. His administration lasted six years, at the end of which the presidency was offered to James B. Angell, then President of the University of Vermont, who at first declined the offer, but the university waited until he changed his mind two years later and accepted. It is a pleasure to record these names, because they are so few. Three presidents in fifty-seven years is a record to be proud of and is worth calling to the attention of some of our younger State universities, which shift presidents biennially or oftener. The stability, uninterrupted prosperity and astonishing growth of the University of Michigan must be largely due to this continuity of administration. For more than half its life the university has had a single head, a man of remarkable executive ability and tactfulness, who has always commanded the confidence and respect of the people of the university and the people of the State. Three times he has been called into the diplomatic service of the nation for one or two years, as Envoy Extraordinary and Minister Plenipotentiary to China in 1880, as commissioner for the negotiation of a treaty with Great Britain on the fisheries question in 1887, and as Minister to Turkey in 1897.

This is a critical year in American education, when three of the oldest and most experienced college presidents retire together—Eliot, of Harvard, at the age of seventy-five, after forty years of service; Northrup, of Minnesota, at the age of seventy-five, after twenty-five years of service; and Angell, of Michigan, at the age of eighty, after thirty-eight years of service, plus five years as

president of Vermont. Such men are rare, and we must feel some anxiety for the future when we realize that the chances are against finding successors who will prove as able and reliable as they have been. All three retire voluntarily while still vigorous and in full possession of their faculties, in order to leave the field to younger men.

President Angell is a large man in every way, able to take up shocks, buffer-like; a diplomatist, even tempered, judicious and unworried. He has in recent years been governor of the institution in the steam engine sense of the word, keeping things running smoothly,

sors were often impeded by their turning the tables on me by inquiring what was being done in other institutions to solve the problems confronting Michigan. The faculty and senate meetings are anything but dull; they are not formal academic debates or perfunctory registrations of routine business, but are filled with real controversies over vital issues, and not unenlivened occasionally by manifestations of the pure joy of conflict.

The cause of this activity is simply that the younger generation has come knocking at the door. Until the recent changes, the average age of the author-

Copyright, 1906, W. T. Littig & Co., New York.

A GENERAL VIEW OF THE MICHIGAN CAMPUS

rather than supplying motive power or guiding in new directions. This has not been on the whole a detriment, in my opinion, first, because the university is not suffering for want of a revolution, and, second, because it has thrown a large measure of responsibility on the faculty. They have been compelled to take the initiative and to do some planning for the university as a whole, instead of each man working solely for the interests of his own department, as is apt to be the case where there is a dominant executive. Nowhere else did I find so much earnest discussion of the larger aspects of educational policy. My efforts at interviewing the various profes-

ities of the university—president, secretary, and influential members of the faculty and Board of Regents—was over seventy years. But there is a yeasty young element in the faculty; new men who, individually and organized into various groups, have been persistently agitating divers scholastic reforms, and fretting because the progress is not commensurate with their earnestness and energy. It is natural, on the other hand, that the older men in power should fail to see the need for radical changes in the established order, and should ascribe to the desire for personal advancement a greater share in the movement than it really has. It would imply disrespect for

precedent if I should fail to refer in this connection to the story told by Oliver Wendell Holmes of the session of the medical faculty of Harvard forty years ago, when, in reply to an indignant inquiry of one of the older professors as to why the good old ways were being so upset, Mr. Eliot calmly said, "I can answer that question. There is a new president." The situation in Michigan just now is somewhat similar, but with one important difference. The reply of the younger element to this eternally recurrent question has to be in most cases, "There is a new instructor," and this answer does not have the same convincing sound, even assuming that it has the same force of character behind it.

I do not mean to imply that the faculty at Michigan is rent by dissensions or contains more discordant elements than other faculties. This is not the case, and I regard this activity as a very encouraging feature, referring to it merely to explain why it is that there is a jar and clatter about the administration that contrasts with the smooth-running or non-running machinery of some of its rivals.

As an instance of the conflict of present-day tendencies with the older ideals of the university, I will take a trivial question, the introduction of the Phi Beta Kappa. This is an honorary society, dating from 1776, to which are elected in most colleges students who have manifested superior scholarship and literary ability in their undergraduate work, usually about a tenth of the Senior class. In some institutions it is a highly prized distinction, with some tangible benefits; in others it is an empty honor, being conferred on a class just going to leave after all their schoolmates have left, or no honor at all because it brands the initiate with the name of "grind" or whatever the local term may be. In co-educational institutions, if it is awarded strictly according to grades, it is apt to be monopolized by the more diligent sex and goes by the name of "the woman's club." It is non-secret: any member may and some of them can give the Greek for "Philosophy the Guide to Life." At a reunion the public may look on while two "old grads" fum-

ble with their fingers trying to remember the grip.

Well, when it was proposed to put the Phi Beta Kappa in the University of Michigan, President Angell opposed it on the ground that it was contrary to the spirit of the institution, and undeniably it was. Prizes, badges, robes, honors, distinctions and all such extraneous bribes to scholarship are contrary to the historic ideals of the University of Michigan. But this is Tag Day everywhere, and the Phi Beta Kappa, with the help of the Zeitgeist, got in. Then appeared a difficulty. How could those Seniors having the highest grades be elected when there are no grades? The Examination Report blank has in its upper left hand corner abbreviations for four different kinds of failures, but only one kind of success, just plain "Passed." The University dismisses its graduates with a simple "Well done," the adverb insusceptible of comparison. It is not worth while giving the ingenious method by which this obstacle was surmounted by the Phi Beta Kappa. The university will before long probably succumb to the inevitable and adopt the grading system and all the rest of it. Still, one does not love the Inevitable any the better for such victories as these.

Another and more important example of change in policy now being forced upon the State universities, contrary to their fundamental principles, is in the regulation of student affairs. The theory of the State university is that the State here offers at great expense, but free to all its young people, the opportunity for an education. It is like a fountain in a public square, giving its water freely to every passerby without regard to whether he has food and clothing, or whether he spills the water in carrying it to his lips. The assumption is that nobody will come to the university unless he is earnestly desirous of an education. Unfortunately, this assumption is not justified, perhaps less justified nowadays than when higher education was less common. The "leisure class" is becoming an appreciable factor in Western universities, altho still far smaller than in the Eastern. It is becoming evident also that the ordinary well-meaning student needs more looking after than he has been getting.

Anyway, the laissez-faire policy is breaking down all along the line, in university as in civil administration, and even those of us who were inoculated in our youth with Mill and Spencer have to admit the desirability of the change.

Good teaching has always been one of the strong features of Michigan University, even during the period, now happily closing, when good teaching was regarded as a sign of mediocrity. But it has been decidedly improved in efficiency of late by the adoption of more stringent regulations in regard to attendance on class exercises and the like. If a student is doing poor work, some effort is now made to find out why, and sometimes it becomes apparent that the student was not the only one to blame. Entering students are now assigned in small groups to advisers and in many other ways efforts are being made to bridge the gap, which in Michigan had become unduly wide, between faculty and students. The appointment of Prof. J. O. Reed as Dean of the Department of Literature, Science and the Arts has caused a general "bracing up" of classroom work. The old "take-it-or-leave-it" air is giving way to a new spirit.

A part of the same movement is the greater attention now being paid to the private life of the student. The Eastern universities ordinarily provide both instruction and lodgings and charge for both, altho in neither case what they are worth. That is, the total expense of the college course is shared between the college and the student. It is also shared in the case of the State university, but in a different way. The university provides the instruction without charge, and the student bears all his personal expenses. This is a pretty theory, but pretty theories, like pretty girls, do not keep their looks as they grow old. Neither plan, in fact, works satisfactorily. College dormitories and dining halls have often proved annoying to manage and expensive to maintain, and in many cases private dormitories and boarding clubs, self-supporting, have proved more attractive to the students than the accommodations provided by the college. On the other hand, private enterprise, given a free field by the State universities, has not furnished the sort of accommoda-

tions that the students ought to have. The fraternity houses provide a part of the students with pleasant and comfortable homes, but have brought with them certain evils that are causing anxiety everywhere. The poor student who "baches it" on crackers and prunes, and puts in twenty to forty hours a week at hard labor, is not getting the most out of his college course. And between these is the great body of young people of both sexes, picking up a precarious living in boarding houses, sporadic clubs and private families of all sorts and conditions. A town which is dependent on a college for its support gets to regarding the students as its prey. It resents any interference with its proprietary rights. It weaves around the college a network of intertwined interests, like that which in Switzerland protects the tourist industry.

There is, besides, as I have said, the traditional opposition to paternalism. When I was a student in a State university the feeling against dormitories was so strong that, if one had been offered to the university by some philanthropist, it might have been rejected as an insult. Such a rule as that recently adopted by Princeton, requiring all Freshmen and Sophomores to eat together at a certain place, at a certain price, would have been regarded as an intolerable tyranny. But times change, whether we change with them or not. Now the universities everywhere are beginning to realize the need of something of the kind, altho legislatures have not yet come to the point of passing appropriations for such purposes. This is just the time when philanthropy should come to the rescue and establish student homes on a semi-self-supporting basis. The various religious denominations could do more good in many cases by maintaining residential halls in connection with the State universities than in keeping up their small rival colleges, which often contain fewer members of the denomination than does the State university. In Michigan certain capitalists propose to erect a large dormitory, with commons and club rooms, under student control. Such a building, properly managed, would be of great benefit to the university, and the undertaking, tho purely commercial in its motive, might well receive such unofficial encour-

THE FLAG RUSH BETWEEN THE SOPHOMORES AND FRESHMEN.

agement and support as the authorities can give.

There are more undergraduate students at Ann Arbor than at any other university in the country, 4,477 in 1908, Harvard following with 3,876, and Columbia with 3,803. They have been left largely to their own devices, and the devices have not always been of a creditable character. Class scraps and "horsing" have had no accepted restrictions or regulations. Hair cutting, face painting, house raiding and kidnapping became epidemic. Freshmen were treed and egged and put thru such stunts as sophomore ingenuity could devise. The class rush on "Black Friday" was preceded by a week of general disorder and excitement, seriously interfering with regular work. The student shows and parades sometimes contained features offensive to good taste and propriety. Press reports of such things, exaggerating the disorder and eliminating its redeeming

factor, the good-natured boyishness of it all, have given the institution a reputation that in my opinion it does not deserve. The Michigan boys do not, I think, behave any worse than those in other universities, but they make more noise about it.

A decided reaction has set in within the last year or two that promises to bring about a better order of things. The Law Department, as is appropriate but not necessarily to be expected, led in the reform. The class rush in its old form has been ordered abolished and some substitute, such as push ball and the tug of war, is being sought for that will eliminate its brutality while retaining its strenuousness. The hair of Freshmen, even tho too long for the style, is undisturbed. The Senior and Sophomore drinking clubs, the "Friars" and the "Pipe and Bowl" have been ostensibly extinguished. What is more encouraging than faculty action is the spontaneous change in public

opinion among the students themselves. One or two of the saloons have gone out of business for want of their former student patronage. But in the recent election, when so many counties in Michigan went dry, the County of Ann Arbor did not. This does not speak well for the civic influence of the university on the community in which it has been situated for over half a century. If the saloons are not to be banished from Ann Arbor as they have been from Cambridge, Berkeley and Urbana, they should at least be kept decent.

The most important duty of the next president will be the development of a sense of self-respect and responsibility on the part of the students. The students are not yet ready for such a system of self-government as prevails at Princeton and at California, nor, it must be said, are the faculty. Last fall, when a student was caught cheating, one of the

professors called a jury of his peers, who found him guilty and advised his suspension for a year, but this sentence was not confirmed by the faculty, who regarded the proceeding with suspicion as unauthorized and irregular.

There is a Student Council, but it has little power, and that little is not always exerted on the right side. Its ineffectiveness in a crisis was shown last year, when a mob of a thousand students wrecked the Star Theater, a nickel moving picture show, whose proprietor had offended them by putting out a disorderly student. On the following night they smashed in the windows and demolished the piano and furniture. The Mayor, the fire department and the few policemen the town affords were powerless in the hands of the students. President Angell was sent for and made a speech to the students, but they paid no attention to him. Dean Hutchins, who is as

SIXTY-FOUR FRESHMEN CAPTURED AND BRANDED

The custom has been recently abolished.

highly respected as any professor, also appealed to them in vain. The theater, an adjoining saloon and the fire department claimed damages to the amount of \$3,500, but a settlement was finally made for \$1,000, and the criminal charges dismissed. The Student Council raised a large amount of money for the defense of fifteen students arrested, some of whom were quite innocent, but it made no attempt to search out the more guilty parties, and has done nothing to prevent the recurrence of such an affair in the future. Of course, theater disturbances are not unusual elsewhere being established customs in some universities, and the anticipated damages paid for in advance, but the lack of official control and of self-control points the way to a needed reform. The Student Council having failed to ameliorate the fall rush, the faculty Senate took the matter in hand, and among other regulations, provided that it be held in the daytime, whereupon the Student Council passed a different set of regulations, putting the rush in the evening, as formerly. Athletic affairs are still in confusion, in spite of or because of the fact that students, alumni, faculty and regents have in turn tried their hands at rules and management. Michigan withdrew from the Western Conference a year ago because of dissatisfaction with the eligibility rules.

As I have said before, all State universities look alike to the Easterner. Yet in reality they all differ among themselves in language, institutions and laws as much as do Yale, Harvard and Princeton. I shall have failed in my task if I do not make plain some of the grosser distinctions as the five here taken into consideration are in turn described. Of course, each of the universities regards itself as responsible for the education of the people of the State, and as neglecting its duty if it fails to provide training in all of the common professions except divinity. But these professional schools, tho having a certain specious equivalence in the catalogs, are in reality very unequally developed, and the absence or overgrowth of one of them shifts the center of gravity of the institution. For example, the University of Michigan is sharply differentiated from the other four universities—those of California,

Wisconsin, Illinois and Minnesota—in that the State agricultural college is not a department of the university, but is a separate institution, located at Lansing. This does not make much difference with the composition of the student body, for until recently the number of agricultural students of collegiate grade in the State universities has been absurdly small, but it cuts off the university from the receipt of the funds given by the United States Government for the support of agricultural education and research. The States that have separated the agricultural college from the university in order to appease local ambitions have suffered from it, because there is a great loss of money and still more of efficiency thru the duplication of buildings, laboratories, libraries and professorships. It is, of course, the departments of chemistry, biology and engineering that are most strengthened by the presence in a university of the agricultural courses and experiment station work. A minor effect on undergraduate life is that Michigan, unlike the other four universities mentioned, has no military drill for the students, the *Didaxia of Polemitactica* never having materialized. The educational forces of the commonwealth are still further scattered by putting the School of Mines at Houghton, on the Upper Peninsula, which is practically another State, instead of making it a department of the university, as in California and Minnesota.

But by the law of compensation, to which we are accustomed to refer facts not otherwise explicable, the University of Michigan has developed larger and stronger schools of law and medicine than are to be found in the other State universities. The Law School is, in fact, the largest in the country except that of New York University. It draws nearly 70 per cent. of its students from outside the State, and the fees of the non-residents, tho only \$65 a year, \$10 more than for Michigan residents, more than pay the salaries of all its professors. At present it requires only a high school preparation, but a six-year combined course is recommended to the students, and its faculty is trying to get the consent of the regents to require a year of collegiate work for entrance.

In the medical department the six-year

combined course is now compulsory, that is, two years of collegiate work are necessary for admission. Here also more than half the students come from other States. It is the most striking exception to the rule that a first-class medical school cannot be maintained outside a large city, for Ann Arbor has only 16,000 population besides the students.

Three duties has a State medical school: to train practitioners, to advance the science, and to promote public hygiene. The University of Michigan performs all these well. It has good hospitals under its own management, including a psychopathic ward with a building of its own. It was in Professor Novy's laboratory that the existence of the bubonic plague in San Francisco, which the Californian authorities were denying, received an unexpectedly complete demonstration by a student who accidentally imbibed a few millions of the pernicious protozoa. The university is now beginning a campaign of education against tuberculosis, which will cover the entire State.

Another movement for the benefit of the State is forestry. More than half of Michigan is still wild unsettled land. Six million acres, one-sixth of the entire State, have reverted to the State on account of non-payment of taxes. Most of this is burned-over pinery and stump waste. Professor Filibert Roth, of the university, is Forest Warden, and is training his young men by a college course of five years and practical experience in the forest reserves in his charge, to reclaim and make profitable to Michigan its idle territory.

The engineering department is by far the largest of the vocational schools, and offers some unusual courses.

At Princeton and at Yale I was repeatedly asked: "Have you seen the tank yet?" At Michigan I was asked the same question, but it had a different significance. The tank that is Michigan's pride is a canal 300 feet long, 22 feet wide and 10 feet deep, in the laboratory of marine engineering. Boats ten feet long, carved out of paraffin, are run back and forth thru this by trolley, and the dynamometer records the resistance. In this way the best possible curves for the hull of any vessel can be worked out experimentally. The field facilities of the

department of engineering have been enlarged by the gift of 1,500 acres on Douglas Lake as a summer camp.

It is often said that a summer school can only prosper in city universities. Here again the experience of Michigan contradicts the generality. All departments at Ann Arbor are in full blast for eight weeks and the work done deserves and receives full credit. In fact, the work is of a more advanced character than in the winter terms, and the proportion of graduate students is very much greater. In the summer session of 1908 there were 1,077 students, representing forty-two States and Territories and sixteen foreign countries. About a fifth of them were college graduates, having degrees from 104 different institutions. In the medical department 35 per cent. were college graduates and 14 per cent. practising physicians.

The summer school movement is one of the most important developments of university education in recent years, and will be discussed at some length in later articles, but I must say here that its chief advantage, in my opinion, lies not in the utilization of the plant and the shortening of the college course, but in that it brings back to the university men and women engaged in all lines of professional work. Teachers in schools and colleges who want to learn at first hand the latest news from the frontier of knowledge and to acquire the new ways of pedagogy; doctors who want instruction in recent methods in medicine and surgery; engineers who need help in some novel problem; inventors who desire an opportunity to work out an idea, and ministers who wish to get into the current of the thought of the day or to study the newer methods of philanthropy; all have come to realize that the university can be of some use to them. Many of these are not candidates for an advanced degree, do not care for a degree and cannot be induced to work for one, but want some man's ideas or technique and will go after him wherever he may be. This class of "special students," useful for swelling the roll of the graduate school, but sneered at by rival institutions, and viewed with suspicion by the Carnegie Foundation, will, I think, prove to be an important and wholesome influence in our universi-

ties. It is generally recognized that one of the drawbacks of the teaching profession is the constant contact with immature minds. The graduate students who have never left school retain their attitude of pupillage, but the returned graduate will exert a countervailing influence on the psychology of the professor. The returned graduate—what should we call him, a recidivist?—is self-reliant and independent, also intractable and undeferential, being himself accustomed to deference in his local circle. He is impatient of red tape and intolerant of slouchy teaching, and he has a contempt for pretentiousness in other people. His ideas are practical and will tend to counteract excess of academicity. The special student is now being brought into the university circle chiefly by the summer school, but he will not confine himself to that.

There is another way of effecting a closer union of State and School besides this of bringing the people to the university, and that is bringing the university to the people. In the first the University of Michigan has been pre-eminently successful. In 1880 there was one Michigan student in the university to every 2,407 of the population of the State; in 1900 the ratio was one to 1,206; in 1907 it was one to 973. In the second of the duties or opportunities, that of university extension in its various forms, such as farmers', teachers' and mechanics' institutes and courses, correspondence teaching, and work in lecture and library centers, Michigan has not been so active as some of the other State universities, notably Wisconsin.

An opportunity for expansion into a new field seems to me to be afforded by the development of the educational department of the university. Some universities, like Yale, Princeton and Pennsylvania, give no attention to the training of teachers. Others, notably Columbia and Chicago, have large and well endowed teachers' colleges, with model schools for practice and experiment. Michigan belongs by its history in the latter class, for, as I have explained, its connection with the public-school system has always been close. President Angell in 1874 recommended that instruction in pedagogy be given, and five years later

the first American Professorship of the Science and Art of Teaching was established. The obstacle to the further development of this work at the present time is the lack of facilities for practice teaching, because the university has no model school, and the schools of Ann Arbor do not give sufficient opportunity for such work. Under these circumstances it seems to me that the question of training, at least for high school and college work, could best be solved by sending the advanced students into the high schools of the State. In this way the high schools could add a fifth year or strengthen the fourth, giving a greater variety of courses at very slight expense. Local school boards cannot afford to hire a competent instructor for the three or four students who may wish to take Greek, or chemistry, which is getting to be as rare as Greek. Therefore students are either shut out from certain lines of collegiate work for lack of preparation or such classes are taught by an over-busy principal or by an incompetent assistant, who has to study the next lesson over night and even then sometimes to dismiss the class before the bell rings to prevent being carried over into unexplored territory. There could be a special peripatetic faculty for such work. The circuit rider professor would visit each high school in his district once every week or fortnight to give a lecture or conduct a recitation, and to see that the class drill is thoroly done by the teacher-in-training. The objections usually urged against such inexperienced teachers would not hold in this case, because they would be giving their own specialties under the direct control and guidance of the university professor, with whose methods they are familiar. That is, the high school pupils would then be under the same kind of instruction as most of the lower class students in large universities. The teachers in training would find out whether they were fit for such a profession; they would get credit on their university course for such practical work and they would be partially self-supporting. The pupils in the town could remain at home for a year or two longer, thus saving themselves expense and relieving the university of much of its elementary work

and the embarrassment of their youthful spirits. The Massachusetts Legislature has before it a proposal to utilize the high school buildings for giving a complete college course in every city. If such a plan is not impracticable in Massachusetts it would be easier to introduce

foundations, which were from the beginning made to coincide with the boundaries of the State. At the same time the superstructure must be raised in accordance with the design of its founders. That it has been so far predominantly an undergraduate institution is not to be

Photograph by A. S. Lyndon, Ann Arbor, Mich.

CUTTING A MODEL BOAT OUT OF PARAFFIN

To the right is the tank for testing its efficiency.

where the State university system prevails, especially in Michigan, where it would be merely carrying out the original scheme of the university. It is primarily a question of which is the more mobile, a professor or a class. At any rate, we must recognize the fact that both are more mobile than they used to be, whether the centripetal or the centrifugal force prove the stronger. Our colleges seem to be still in the stage-coach period, unmindful of the new fields opened to them by trolley and express.

The next step in the future of the University should be its expansion in this or some other form until it fills out its

hastily set down to its discredit. It means rather that the University has done conscientiously the duty which lay nearest. All of the State universities have been swamped with undergraduates and have not yet been able to provide buildings and instructors fast enough to accommodate them. But now it is felt that the time has come to demonstrate that a State can provide for its citizens not only the higher education, but the highest. Like the other State universities, Michigan is now making special efforts to develop its research work. In response to the pressure of the younger element, of which I have spoken and in

particular a frank exposure of the deficiencies of the institution in the *Michigan Alumnus*,* the last year has seen a great change in this respect. The latest report of the secretary of the Graduate Council, April, 1909, gives 258 graduate students, including those in the professional schools. Of these 93 were in the summer session. This is an increase of 135 per cent. in the last six years. About one-quarter of the number are working for the doctorate, the most popular departments being English, philosophy, Germanics, chemistry, and physics in this order. Last month I gave a long list of monographs and periodicals published by the University of California, for which the University of Michigan can show no parallel. There is a "Humanistic Series," in which three volumes of valuable classical studies have been issued, and three periodicals.

But it must be remembered that the explorations and investigations of the University of California have been made by the aid of special gifts, and the University of Michigan, altho it has a very large body of alumni, has received no such extensive donations or bequests.

The University authorities have doubtless been wise in their policy not to spend the people's money on architectural display so long as the incessant demand for room continued, but this is no reason for the complete disregard of harmony and system in building. I have alluded to the similarity in spirit and principles between Harvard and Michigan. The resemblance extends to their architecture. The campus in both cases has been built up on the elective principle. The arrangement of the buildings is much the same as when a child dumps his Swiss village out of the box on the floor. In Michigan the architectural department has prepared plans for the development of the campus, but no regard is paid to them in the planning of buildings.

There is no agreement as to style, material or color. The most recent addition is in the crudest possible contrast with all the others and it has been placed in the most crowded part of the campus twenty feet out of line with its neighbors.

This is the Alumni Memorial Building, more commonly called either "the D'Ooge's Palace," in honor of the distinguished professor of Greek who was instrumental in getting it, or the "mausoleum" by those who always associate marble with tombstones. There was much disappointment among the students because this building does not provide their much needed commons and clubrooms, but will contain the offices of the alumni association and the paintings now hanging in the library. There seems to have been a feeling on the part of the promoters of the building that it would be a desecration to have eating and playing in an edifice sacred to the memories of fallen soldiers. But Harvard, surely an authority on such matters, finds no impropriety in using a memorial hall for such purposes, and there is classical precedent for the custom of honoring the heroic dead by feasts and games.

The well-wooded campus makes a pleasant impression on the visitor, and many of the buildings, individually considered, are handsome and well adapted to their purposes. There is a good deal of building going on this year. The new dental building, just completed, of red brick with stone trimmings, is admirably arranged and equipt. The four-story chemical building, now being erected of iron-shot brick with a terra cotta cornice, measures 230 feet by 130, and is well lighted by two inclosed courts, one of them on the lower stories occupied by a large amphitheater. On a hill beyond the campus the visitor's eye is attracted by the glint of a copper dome, with minor bulbs like onion sets sprouting up around. This will house the new 37-inch reflecting telescope which Professor Hussey will use in adding to the collection of double-stars that he began at Lick. Between the Observatory and the campus is Sleepy Hollow, which will now have to change its name, for it has been bought by the Woman's League as a playground for the girls. Near by is the Barbour Gymnasium, which is more than a gymnasium, for the women in the university have made it the center of a social life of their own, which does not, however, interfere with a due amount of association with the opposite sex both in work and play. Here they give their re-

*The *Alumnus* is a quarterly publication of the University of Michigan. It is published by the Alumni Association.

ceptions, dances, teas, plays, literary entertainments and "smokeless smokers," to which they may or may not invite the men, just as they please. This has cultivated in the women students a spirit of independence and self-reliance without developing any antagonism between the sexes. The women are, on the whole, treated with fairness; that is, they receive the treatment they individually merit. Some of the fashionable fraternity set refuse to invite them to social events of importance, but that is not altogether an evil. Since Michigan was the first of the greater universities to adopt co-education, we may expect a similar development in the other universities. It is sufficient to say that none of the dire prophecies made in 1871, when the women were admitted, have come to pass.

The women of the university, as was to be expected, were ahead of the men in establishing a social center. Now, however, a start has been made toward providing a place where all the men students may feel at home by the purchase of the residence of Judge Cooley and its conversion into a clubhouse, the Michigan Union. There are now in the University twenty fraternities in the literary department or college and thirteen in the professional schools. All these have their own houses, as have also the nine sororities. Then there are ten sectional

clubs of students from a particular State or city, six literary and debating societies and six musical organizations, which, with the athletic teams, church gilds, etc., make up a total of 176 student associations. Yet an analysis of the membership shows that less than a tenth of the students take part in any of them except the fraternities and sectional clubs. It is evident, therefore, that the University as a whole is not over-organized, as is commonly believed. The real problem of the great universities is how to reach the submerged nine-tenths and to give them a little share in such voluntary student activities. I must not omit, tho I can merely mention, a movement that is apparent in many of the State universities, but has reached its highest development so far in Michigan—that is, the establishment of extra-territorial religious instruction. There are four buildings supported by the Churches for work among and by the students, and the list of "Studies in Religion" for 1908-09 (which should be sent for by all interested) gives 48 classes and lecture courses in Christian philosophy and ethics, biblical study and church work, by members of the faculty, student pastors and speakers from abroad. In this way another Tappan dream is coming true, the missing faculty of theology is being supplied by individual effort, and the State university is made complete.

NEW YORK CITY.

The Tettix Sings

BY J. VALLANCE BROWN

BLIND? Be it so. Yet still I see
The planes and figs, the gray-green tree
Athene loved, the vine-grown lea,

The haze-veiled hills, the dear, deep blue,
Each mellow line, each chastened hue
That makes Greece fair—the Greece I knew;

The satyr goat, the peasant carts,
The sail-flecked Gulf, old Athens' marts,
The folk afield—stanch, simple hearts;

Sweet sun-kissed cheeks and lips and eyes,
(Ah me! Dear eyes in whose deeps lies
A love I see not, yet surmise);

The glamor of the days of old
When Helen smiled and knights were bold,
When Phidias carved the Attic hold

To shrine the maid of mystic birth,
To body Hellas' wit and worth,
To flash the arts thru all the earth.

The long, sweet, summer noon! All things
Are hushed—Pan's hour—all, save thy wings.
Blind? No! I see! The tettix sings!

TARKIO COLLEGE, TARKIO, MO.

The Crystal Seers

(Being the Confession of Moen James Jaques, Horse Reporter)

BY FRANK CRANE

I AM going to write the plain truth about the origin of the widespread organization known as the Crystal Seers. And for this I am qualified, being the one who devised the scheme.

The proposition was conceived in the most cold-blooded way. There were three of us, all graduates of Yale, 1895. We met casually in a German restaurant on Thirteenth street, New York, and fell to talking over old times.

First, there was the Reverend Henry Alford Tompkins, who had just resigned from a little Unitarian Church in New England. He had been successively a Methodist and an Episcopalian before he had become a Unitarian, and now had left the last-named faith and was theologically, as well as financially, at sea. Tompkins was an attractive fellow, tall, lantern-jawed, and with an imposing, spiritual face. He had a wonderful gift of language and could talk endlessly and entertainingly upon any topic and upon any occasion.

Then there was Dr. Karl Lester Harkaway. He had graduated at a medical school, after leaving Yale, had hung out his shingle in the American metropolis and was having hard work to pay his rent.

Lastly came myself, Moen James Jaques, who had been grinding away at newspaper work and writing for the magazines (things that were seldom published), and living from hand to mouth among the New York myriads who are hanging by their eyebrows above the abyss of failure.

After a solid lunch of pig's knuckle and sauerkraut, washed down with several scidels of Pilsener, conversation was loosened. The topic of success arose, and we were all of one opinion, to wit: that it is the faker who wins the laurels in the great game of "getting on."

"You just look at the preaching business," said Tompkins. "I've been honest, and what's happened to me? Screwed! That's what. Down and out!

You take your full churches and popular preachers, and in every case it is some sort of fake that causes them. There's Dr. A., of Boston—most renowned—great audiences—wonderful sermons, and so on—wouldn't last a week if he was not backed by a bunch of millionaires whom he has hoodooed. In the last analysis he simply stands for the spiritual power of massed money. Of course, he's a fairly good speaker and considerable of a man, but there are a hundred preachers in Boston who could do the business fully as well in his place. Then there is a fellow by the name of B., whom I knew in Woonsocket—couldn't preach any more than a rabbit—but he was genial, smiling and an assiduous jollier. What was the result? Church packed and crowds turned away! And there I was in my meeting house dealing out the real stuff to a baker's dozen. And so it goes."

"It's the same way with the medical profession," added Harkaway. "They claim to abhor quacks. Every successful physician is a quack. It's all sly ways of advertising, and an appearance of wisdom, professional secretiveness and all that. Oh, it makes me sick! If a doctor goes around telling the truth he's driving right over the hill to the poorhouse all right."

I added my testimony. "It's just the same with writing. The popular author is the best jockeyed author. I have written no end of stuff that Kipling & Co. couldn't touch with a ten foot pole. What's the answer? Nothing doing! Manuscripts returned with printed thanks. These magazine editors just pound the sidewalk between the lunch counters and their offices and wouldn't know good literature if they fell over a piece of it in the street."

"Bah!" said Tompkins.

"Bosh!" said Harkaway.

"Hog wash!" said I.

So each of us got out our little hammer and we had a regular anvil chorus,

knocking everybody and everything that was successful.

Suddenly, as I was looking into my empty beer glass, I had an idea—The Idea!

"Boys," I said. "I've thought of something. I won't say now what it is. I want time to let it simmer a bit. Come back tomorrow at this same hour and I think I'll have something interesting to tell you."

The next day found us all three at the same little table in the corner. Then I outlined to them the result of my meditation.

"Now, here's the situation," I began. "Here are three of us, well-educated, capable and untrammelled by families. The world is before us. We're simply chumps if we don't arise and take."

"You're all right, so far," said Tompkins.

"You just hold on," I added. "Let me develop my idea in my own way. First, what do we want? Why, we want success, money, fame, life and plenty of it. Second, how are these things gotten? Answer, simply by faking."

"Now, we three here represent the three great professions infested by fakers of all time, religion, medicine and literature."

"Why haven't we succeeded? Because we have been wooing the blest minority. Mankind is divided into two classes; nine-tenths are fools, and one-tenth have common sense. The first thing we want to do, therefore, is to cut loose from that one-tenth. They're honest, but they haven't any money nor any doughnuts."

"Now, you turn to the great majority. What do they want? They want to be humbugged, as Barnum said. They like it, and are not happy until they get it. If you're going in for truth and the simple life and the *magna est veritas* business you want to get you a farm and learn to milk. But if you want champagne and caviar you've got to get complex and hand out the confidence talk."

"Next step. This is a materialistic age. The other world racket won't go. You have to appeal to people's love of pleasure. Now the great mass of rich people are jaded, with their mansions and diamonds and yachts and so on. They want something new. And I've got it for 'em."

"Just look at the patent medicine business! Millions in it! And clean swindle, all of it. People take their nostrums because they want something; they're dissatisfied."

"And they want something they don't understand. A thing's got to be mysterious and woolly to go. There isn't a considerable city in the United States where there isn't some sort of Thought Vibration or Higher Life or Esoteric faker, usually a woman, who has a big following and is taking in the greenbacks hand over fist."

"People want a fetish. We're all barbarians at the core and we want some sort of outlandish contraption to stimulate our imagination. And I have it."

"This is it. You see, I hold in my hand just a common, ordinary crystal—bought it in a department store at the counter where they sell children's marbles."

"You are, of course, familiar with the fact that in the dark ages the hoodooists used to look into crystals and see any old kind of a thing you might ask."

"Now, my notion is simply to revive that cult. Found the Brotherhood of the Crystal Seers. Get people to buy these marbles at \$5 apiece—cost us three for a cent—and show them how to see life, health and happiness by just gazing at this thing and hypnotizing themselves."

"Bug house!" ejaculated Harkaway.

"There you go!" I retorted. "I supposed you'd want something nice and reasonable, and go on the rest of your life eating frankfurters and cheese. I tell you, this is the biggest fool thing anybody ever heard of, and consequently it will go like hot waffles."

"You see it has every qualification. It is mysterious, it is silly, it is antique. What more do you want?"

"Say," said Tompkins, "I'm beginning to see a light. We could hire a hall, you know, and have meetings, and—and—"

"Sure!" said I. "There's where you come in, Tompkins. You load up on a lot of crystallographic wisdom and hand it out to them Sunday afternoons. Harkaway will open a down town office and receive patients during the week. I'll attend to the literary and publicity end of the scheme. I have a book in mind now. It will be called "The Crystal

Life." By the aid of Browning and Maeterlinck and the Encyclopedias I'll get you up the dandiest handbook ever, chock full of soul food that not a person will understand and hence they'll be crazy for it."

We discussed further details, and I succeeded in inoculating my two companions with my enthusiasm.

We hired a little hall over on Third avenue and put a notice in the papers advising all who didn't know what was the matter with them, all who had chronic diseases, all who were disappointed in love, and all who felt vague reachings out for the *je-ne-sais-quoi*, to come around at 3 p. m. and hear the Reverend Mr. Tompkins's discourse on "The Crystal Life, or The Secret of Health, Wealth and Happiness."

At the first meeting there were just seven present besides us three. Two of them were free-love cranks, one was an anarchist, two were just plain bums, one was an old man with long gray hair, who was batty generally, and the last was a newspaper reporter from the City Press Association.

Tompkins read a little from Maeterlinck's "Wisdom and Destiny," and then branched out impromptu for forty minutes. He did pretty well, except that he was entirely too plain and sensible in his remarks. It took him some time to practise up until he could talk with absolute incoherence, but he finally succeeded. After several weeks he was able to present a discourse that was entirely satisfactory, burning with earnestness and not a grain of sense in it.

In about a month the well dressed people gradually sifted in, and before two months we had the hall filled regularly. In the meanwhile Harkaway took down his physician's sign and had painted on his office door "Karl Lester Harkaway—Crystallographer."

I ground away at the book and in three weeks it was finished. The world knows what it is. Over two million copies have been sold. The book, bound in morocco, is lying around all over the United States, in people's bedrooms, marked up with pencil and otherwise showing signs of hard study. But the first time I read a chapter of it to my two friends, Tomp-

kins roared with laughter, and Harkaway, with a dazed look, cried:

"Jaques, that's plumb crazy! Absolutely nutty! They won't stand for it."

"They won't, hey?" I replied. "That's so, they won't stand for it, because they'll come a running for it."

Our first streak of fat luck was when Mrs. Lindley Forsythe, a society woman, came to our meetings and proceeded to get mashed on Tompkins. She bought a crystal and plunged into the esoteric inwardness of our faith, same as a bullfrog into a pond. In fact, she outdid us. She would argue with Tompkins after the meeting until the air was blue, and neither of them had the first notion of what they were talking about.

We borrowed money from her to get out the first edition of "The Crystal Life," and elected her an honorary trustee.

The next lucky strike was when the Reverend Dr. Jansmyth attacked us in his pulpit, and I managed to get a column writeup of his remarks in the *World*.

Then the people began to come in droves. We had to get a larger hall. Edition after edition of the book was issued, and we made a clean profit of two-fifty on every volume. Harkaway took a suite of offices in the Metropolitan Life Building and hired an army of typewriters and secretaries. Money was coming in by mail.

I kept on at the publicity department and managed to get several of the magazines to publish our "principles" and an account of our wonderful growth. Some of them knocked us and others praised; but it made no difference to us; on the whole, we found adverse criticism to be the most lucrative. The American people are peculiar. If you pound any man hard enough you'll make his fortune.

My book was reviewed in several of the literary magazines, and the funny part of it is that opinions seemed divided as to its merit, with the balance in favor of considering the work a profound and erudite production. It got so I pretty near thought it was, myself.

Tompkins was a wonder. He developed the most amazing facility for constructing deep-sounding phrases, to such extent that he could hardly let up and

talk reasonably when we were together. The gist of the faith, if it has any gist, is, that what men need is to get out of themselves into a larger life. This they are to accomplish by gazing into the crystal. Thus they project their narrow and pain-beset personalities into the orbital form before them. The lowest life is a line; the next in order is the plane; still higher comes the cubical or four-square life, which, until the arrival of Tompkins & Co. was as far as mankind had attained; but the new and perfect life is spherical, "spherical and luminous"; and of these two qualities the crystal is the symbol. Besides this nonsense my book and Tompkins's addresses had a great deal more to say about the concealed symbolism of the crystal. We ransacked the public library for history and myth and when an interesting fact couldn't be hitched on to our subject we would drag it in by the heels.

The odd phase of it all was the fact that it did cure people of all manner of diseases and do them a great deal of good. Testimonials multiplied.

When the wife of a city official testified that she had had rheumatism for twenty years, and had arisen and walked, sound and well, after using the crystal and reading my balderdash for a week, nobody was more astounded than I. The society world seemed to take up our cult with avidity. It was just adapted to the boulevard brand of suckers.

But perhaps still more surprising was the enthusiastic reception given to our propaganda by educated and intelligent people. Judges, preachers, lawyers, literary stars, wealthy merchants, traveled and cultured persons began to come in. I wouldn't have believed it, if I had not seen it with my own eyes. It stumped even my pessimism when I saw how keen were people of alleged culture to be humbugged and to believe in something that would act as an opiate to their common sense.

Things were going along swimmingly. I was living the Crystal Life at the St. Regis and had Veuve Cliquot for breakfast when I wanted it. I was driving around in an auto that discounted a Pullman palace car, and if I missed anything in the way of a good time I don't know what it was.

And then came the little woman.

She was just an ordinary school teacher and not very handsome, at that, but she cooked my goose. I met her at one of our assemblies and something about her attracted me at once. It was not her good looks, for, as I said, she was rather plain, but the way she looked at a fellow thru her brown eyes, so trusting and honest and straight, was calculated to make trouble.

We talked awhile. Then I called upon her. You know the rest, naturally. It wasn't long till I was heels over head in love. It was the first time I had ever had a genuine attack, and I was suffering.

Then came the crisis. One night, as I was visiting her in her little flat, up on Eighty-sixth street, where she lived with her mother, she looked at me with a look that made me feel as tho I had taken alcohol, and said:

"Mr. Jaques, may I ask you an honest question?"

"Twenty," I answered.

"This is what I want to know," she went on, easily. "My mother has been much taken with your peculiar faith, and to please her I have gone to some of your meetings, and I have tried to read your book. I will tell you truthfully that I do not understand the book, nor can I make the least sense out of Mr. Tompkins's discourses. To me—pardon me; if I am too frank—it all seems insane. Still, since I have known you, it has seemed to me that I could trust you, and I am going to ask you plainly, do you believe wholly in this new teaching, and, if you do, will you tell me in plain English what it means?"

The blood rose to my face, and I grew a little dizzy. I knew that right then and there I was at a fork of the roads. Whatever I said I'd have to stick to. I decided to lie to her. But when I raised my eyes to her face and realized that here was a woman-soul that was going either up or down, according to my act, and that this soul meant more to me than life, my name was George Washington—I just couldn't lie.

And so I told her the whole truth.

She recoiled from me as tho I had been a snake. She didn't abuse me, she didn't say one ugly word, but the expression

upon her face was something awful. Her lips were very white and dry as she dismissed me.

"I think—if you will excuse me," she said, "I will say good-night!"

I left, feeling just the same as a whipped pup.

And I made up my mind that I would get the other two boys together and we'd quit.

The next day I saw Tompkins. And then I discovered that I had not begun to fathom the psychological possibilities of human deception. For it was not because he was making too much out of it that Tompkins declined to quit. In fact, Tompkins was really an honest sort of a fellow. But, to my amazement, I discovered that he had really come to believe in himself and in my book! I couldn't take it in at first, but finally was compelled to acknowledge it. He admitted that we had begun in deception, but, he said, we had stumbled upon a great and precious truth; and then I'll be hanged if he didn't try to convert me by quoting my own book!

Harkaway was equally obdurate, but for a different reason. He had gotten a taste of money and it was too good to let go. He called me several kinds of a fool and declined to join me in exposing the wrong that had been done. In fact, he claimed that there was no wrong; weren't we healing people, he asked, and illuminating darkened lives?

I studied over it a week, and finally made up my mind what I would do. I surrendered every penny of my money and possessions to Tompkins and Harkaway. It was fake money and the fakers ought to have it. Since Martha's look at me—Martha Elton was her name—I had not the heart to try to throw a sop to my conscience by "doing good with my money." It was the devil's money and would bring its own reward. I found no difficulty in persuading my partners to take it.

Then I went to work. I had no trouble in getting on the staff of a daily paper, and I set myself in my spare moments to do some honest writing, if I starved at it.

It was over a year after this that I

met Martha again. I had not dared to look her up, because I knew she would not care so much as to wipe her feet on me. But one day I was walking thru Central Park when I almost ran plump against her!

You could have blown me over with a whisper. I mumbled something and was passing on, when she stopped me by her word.

"Mr. Jaques," she said, timidly.

I turned to her. Her tone was inviting. The look of her eye had none of that concentrated scorn in it which had been there the last time I saw her. Indeed, it was like heaven.

"Why—why—I—you—I—don't you hate me?"

"Won't you walk a bit with me?" she smiled. "I want to talk with you."

Well, we strolled along together. All my old feeling toward her, which had never been entirely extinguished, burst up into a flame. I found myself, before I knew it, turning my heart inside out. I told her how my love for her had cut like a sharp sword thru all the knots of self-deception that had been tying around me, how I had given up the whole business and all its profits just for the look of her eye. I made a good speech, and was feeling pretty tolerable, noble and chesty over being so honest.

She blushed. She walked along in silence a little. Then she said:

"It is all very strange. I was dreadfully sorry for the way I treated you. Then I began to study your book, and—and Mr. Tompkins came to see me some. And I—that is—Mr. Jaques, I have found the Truth. I am leading the Crystal Life."

Once when I was a boy I was hit in the pit of the stomach with a baseball. I felt just that way when she handed me this bit of news. I didn't say anything because I couldn't think of anything but swear words.

I excused myself as soon as I could. She walked on. I sat down on a park bench and said things that I won't print.

She married Tompkins.

What's the use?

W. L. G. M.

Grave Conditions in Persia

BY OUR PERSIAN CORRESPONDENT

[Since this article was mailed from Teheran we have cabled reports that the Shah has been forced again to grant the country a constitution, a desperate and humiliating, and a hopeless concession.—EDITOR.]

APPRECIATING very fully the fact that a narrative of murder, arson and anarchy rarely makes either profitable or pleasant reading, I yet venture to call the attention of the readers of THE INDEPENDENT anew to the miserable and pitiable conditions existing in Persia, as a result of the general political unrest that has swept over the country during the past three years.

Outside of Teheran there is practically no government, except that of the feudal tribes, and anarchy is everywhere rife. The hand of the central government is, at least for the present, impotent, in the face of the red flag, and there is no power to protect the toiling peasant or the honest tradesman. Obviously, all kinds of business is at a standstill, and money is scarce. The siege in Tabriz that has continued since last summer is bringing to the 200,000 inhabitants of the place untold suffering. Cholera, typhus, smallpox and starvation have killed an enormous number of people. The leading physician of the place writes to the Sanitary Council here that during the last three or four months scarlet fever alone has claimed more than five thousand victims from among the children. There are no mails to Europe from there, and the whole region, including Urumia, west of the lake, is practically cut off from the outside world. The situation in Tabriz is exceedingly grave, not only from the conditions mentioned, but also for the non-combatants, for if the city holds out thousands must die from starvation, and if the place falls into the hands of the wild tribes now surrounding it, there is little assurance that these bloodthirsty savages will spare anybody. Resht and the region about the Caspian are in the hands of a revolutionary element, largely imported from Russia. They seem to have control of the Enzeli-Teheran overland post road, altho they have not stopped the regular mails. In the begin-

ning of the troubles the Governor was assassinated. Very recently a Russian gunboat has been sent to Enzeli, the port of Resht.

Three months ago, sleepy old Isaphan awoke one morning to find the Shah's Governor gone and the town in the hands of the Bakhtiari tribe. These people, living to the southwest of Ispahan in the hills, had always been loyal, but the red flag of anarchy was too much for them, and they took a hand in the fight. They are a wild, lawless people; the best that can be said of them is that they are better than the Kurds.

At Shiraz the feudal tribes have taken possession; at Bushire the British have been compelled to land troops to protect the place; while at the sacred city of Meshed the custom house has been looted and the Governor kicked out. The story all over the country is the same.

Kermanshah was one of the last places that remained loyal to the Crown, and this is what happened there the other day. The story is not an unusual one, but it well illustrates what sort of justice is administered by the local Governors.

There lived in this place one Aziz-Ullah, a Jew, who ran a little stocking factory. Among those who worked in his shop was a boy, who was a Sayid, a sect claiming to be the direct descendants of Mohammed, and consequently extremely fanatical. The relation of an apprentice in Persia is not unlike that of a village schoolmaster and his pupil. So, for some misdemeanor, the Jew punished the Sayid, who then left his work. The next morning the boy's elder brother brought him to the factory, and said: "I have punished my brother for leaving his work yesterday and I wish you to punish him also." Thereupon the Jew, who should have known better than to touch a Sayid, gave him a whipping. The boy continued at his work that day and the next, apparently none the worse for his

punishment. But on the third day he did not come to the shop at the usual hour; later his brother appeared and told the Jew that the boy was ill and urged him to call a doctor. The Jew, realizing the seriousness of the situation, went at once to the English doctor, but he could not be found. His assistant, an Indian, went with him to see the boy and gave as his diagnosis heart failure, the result of intestinal disturbances. Whether or not this was the true cause of his illness will never be known, for within a few hours the boy was dead, and in a Mohammedan land a post mortem is impossible. The city was soon in an uproar, and the Jew went to the proper official and gave himself up. After a night in prison he was taken before the Governor, who at once ordered him beheaded. His request for a trial, an investigation as to the cause of the boy's death, was unheeded. Without further words he was led away to be executed. Knowing the terror of the Persian executioner and fearing torture, he took off his clothing and gave it to him. He then without a struggle submitted to the knife, and one long, swift stroke that crossed the great bloodvessels of the neck brought instant death. His body was then mutilated by the crowd, who dragged it thru the streets, finally casting it into a pit outside of the town, where it was covered with filth. Later the Governor sent his men, who buried the body in the Jewish cemetery, in his stupidity thinking that he had seen the end of the affair.

Notwithstanding the fact that the Jew's character and standing in the community had always been excellent, and this was the only thing brought against him, the cry was raised by the mob in the street: "Is the life of only one Jew to be paid for the life of a Sayid?" The word was soon taken up, and before nightfall every Jewish house had been plundered, a number wounded, and at least three more had been killed, while one hundred and forty families were made homeless.

The Russian bank was attacked in the night, and the next day it developed that many of the Jews were not Persian sub-

jects, but were in the place only as traders. The Governor then tried to recover the plunder and make the people pay for that which was stolen and could not be found. He had ordered the death of the Jew to please these very same people. Rather than pay, they put the Governor out of the town and organized "a parliament" of their own. It is not hard to fancy what the result will be.

As province after province cuts loose from the capital, the situation is slowly but surely being recognized. Gloom and utter hopelessness are fast taking the place of the gayety that one once saw here among the rich Persians. The sowing to the winds of graft, oppression and reckless extravagance has brought to the ruling classes the whirlwind of defeat and humiliation. The lower classes are often armed, and murders are more and more frequent. So far there have been no demonstrations against foreigners, altho in a few instances foreigners have had narrow escapes from irresponsible parties in the street.

What is in the mind, if anything, of the British and Russian governments concerning Persia is not known here. But there is a growing conviction in all circles that every hope of autonomous government is gone, and that foreign intervention must come sooner or later in some form. If this is not done soon we may expect years of wandering in the wilderness of anarchy and disorder. To call the present turbulent movement that is sweeping over the country "a reform movement" is a joke. To believe that the central government can restore order or maintain it if it were restored, requires too much faith for the ordinary resident in Persia to accept. The restoration of the constitution promises little in the present condition of the country. Were it re-established the religious leaders would soon take control of it again and carry out their plans, which would not be different from those that have marked all Mohammedan history. In the meantime the outlook for the poor people, who have been guilty of nothing save the misfortune of having been born in Persia, is unspeakably dark.

Labor and the Commissary at Panama

BY W. J. GHENT

[This article, delayed by the illness of Mr. Ghent, concludes our series on Panama. The first article, "Progress in Panama," by Mr. Gardner Richardson, appeared in our issue of April 22d; the second article, "Work and Welfare on the Canal," by Mr. W. J. Ghent, appeared April 29th, and the third article, "The Construction of the Canal," by Mr. Gardner Richardson, was printed in our issue of May 6th. Mr. Richardson and Mr. Ghent were sent to Panama as special representatives of THE INDEPENDENT, to report on the progress of the work.—EDITOR.]

THE Commissary Department of the Panama Railroad was established in 1894, to supply groceries to the heads of departments of the company. The business was enlarged in 1896, and commissary privileges were extended to all employees of the railroad, all steamship lines, warships of any nationality, and consuls and officials of the French Canal Company. Since 1905, under American ownership of the railroad, the privilege of buying from the department has been restricted to canal and railroad employees, with special exceptions in favor of the resident ministers of America, Great Britain and Peru and the American consul-general.

There are certain technical points regarding the ownership and operation of the canal enterprise, which it may be well to keep in mind. The canal itself is purely a government owned property. The railroad and steamship line is actually government owned, but by a temporary loan of one share of stock to each of three individuals becomes technically a private corporation. But, again, the chairman of the Canal Commission, Col. George W. Goethals, is also the president of the Panama Railroad and Steamship Line, and the two enterprises are operated as one. The distinction is nominal only, but there are said to be certain advantages in the pretense. A private corporation has a free hand in buying supplies when it chooses in the open market, whereas a government department must purchase thru competitive bids. Furthermore, a government department is not supposed to carry on a mercantile business in or about the territory of a neighboring nation, while a private corporation may fittingly do so.

So the Panama Railroad remains a private corporation, and the commissary

is a department of the railroad and not of the canal. But the manager of the commissary does not report to the general manager of the railroad, but to the subsistence officer, who in turn reports to the chairman of the Canal Commission. You may study over all this for some time without getting anything very clear. But when you see the actual processes in motion you find that the technical complexities of ownership rather assist than obstruct the efficient working of the department.

The many activities of the commissary department proper were mentioned in a previous article. Some further mention is needed of the subsistence branch. When the Americans took charge of the canal in 1894 they began work without having made any but the most meager preparations in the matter of quarters, subsistence and sanitation. The men were badly lodged and fed, and none of the most ordinary safeguards for the preservation of health had been adopted. As a consequence, disease broke out, increasing for a time in virulence and spreading thruout the Zone. Work was temporarily paralyzed. It was soon seen that no further progress was possible until more careful preparations had been made.

In July, 1905, a contract was made with J. E. Markel, of Omaha, for feeding and lodging the men. A rival firm, Hudgins & Dumas, protested against the letting of the contract on the ground that Markel's bid was in excess of their own. The Washington authorities held up the contract for a time, and a Senate investigation followed. Ultimately the contract was voided, and an indemnity was paid Markel.

In the mean time, Jackson Smith, then head of the Department of Labor, Quar-

ters and Subsistence, realizing the immediate need of the employees, began in a small way to open messes and eating houses, run at government expense. The scheme was regarded as merely a make-shift till some better plan should be adopted. The Commission's report for December, 1906, comments as follows:

"These hotels or mess houses were not opened originally by the Commission as a permanent arrangement, but as a substitute until an experiment could be made as to whether it was better to operate them directly or under contract."

The report declared, however, that the scheme had been entirely successful. At the end of June, 1906, a profit of \$5,000 had been shown.

From this humble and tentative beginning of the subsistence branch has grown a tremendous business. Along the line are 17 hotels, 24 messes for European laborers and 24 kitchens for West Indian negro laborers. In addition, two general hotels—the Tivoli, at Ancon, and the Washington, at Colon—are maintained.

The former is in every respect a first-class hotel. Its rates (to other than canal employees) are exceptionally high, but the food, service and lodging are excellent. These two hotels are intended for the public as well as for employees, whereas at the "Line" hotels, tho the non-employee can obtain food, he cannot obtain lodging.

It is the aim of the officials to run the entire commissary department without profit, giving lower prices and better goods as the income increases. But the subsistence branch usually shows a profit in spite of this aim. For the fiscal year ended June 30th, 1908, the "Line" hotels lost \$21,944.48; the European laborers' messes cleared \$17,044.15; the common laborers' kitchens cleared \$22,147.14; the Hotel Tivoli cleared \$279.14, and the Washington lost \$705.65. There was thus a net profit on subsistence operations of \$16,820.27. In spite of the loss on the "Line" hotels, the service is said to be constantly bettered. A hotel keeper will tell you that he has been rebuked by

CULEBRA FIVE YEARS AGO.

THE AMERICAN QUARTERS AT CRISTOBAL.

Showing the pleasant surroundings and the type of houses in which the Americans now live.

the men above him for trying to show a profit; that better service even at greater expense is the wish of the officials.

A visitor finds the food at the "Line" hotels good and plentiful, varied in character, and cheap in price. The service (in the hands of West Indian negroes) is rather poor and lazy, and a high degree of cleanliness apparently cannot be maintained. Yet it is the food about which the men most constantly complain. The reason is obvious, when one stops to consider it. Day in and day out, the meals have the same general stamp and character, and the sense of monotony in the food service becomes more and more conscious and irritating as the months run by. In a Northern city you may vary your meals as you please. You may go to restaurants of any one of a hundred types, you may try table d'hôte or à la carte as the fancy chooses. On the line you must eat the same general style of meal three times a day, ninety times a month; or else desert the government's eating places, and make your own provision for food.

Increasingly for a time, perhaps still increasingly, men have left the hotels and formed messes of their own. Some of them have married, and of course in their

own homes can provide for the variety they demand. But it is also common for a dozen or twenty men to form a mess, rent a house, employ a negress as cook, and make up their own menus. Many of the men take only one meal a day in the hotels. The consequence is of course a severe loss to the hotels, since virtually the same organization of help and approximately the same expenditure for provisions is necessary in providing for an irregular as for a regular patronage. The officials have tried in various ways to check this tendency, but seemingly without avail. Anything that would break or modify the unceasing monotony of the food service would be helpful, but nothing of this sort seems so far to have been tried. The tendency is equally strong with the Europeans and the West Indians. Tho the overwhelming majority of all employees continue to eat at the government tables, the desertions are serious enough to make imperative some change in the form of the food service.

The men agree, however, that the government's food is better and cheaper than could be furnished them by a private contractor. Markel contracted to give meals to "gold" employees (white Americans) and their families at the rate of \$30 per

month for persons over twelve years old, and for \$10 per month for persons between five and twelve; by the day, \$1 and

A SECTION OF THE PANAMA CANAL.
A view looking north from Pedro Miguel toward the Culebra Cut.

40 cents; by the meal, 33 1-3 cents and 13 cents. For maintenance, he asked \$6 per month for employees over twelve, and nothing for those under twelve. For "silver" employees (European and negro laborers) he asked \$12 and \$5 per month, 45 cents and 20 cents per day, and 15 cents and 10 cents per meal for persons of the same age distinctions.

The government gives free quarters to all employees and their families. It gives a flat rate of 30 cents per meal to all "gold" employees, 40 cents per day to all European laborers and 30 cents a day to West Indian laborers. The 40 cent rate includes wine for certain holidays. These rates, to say nothing of the free quarters, are considerably cheaper than those offered by Markel. No one supposes that he would have given better or more plentiful food. It is hardly to be supposed that he would have built a cold storage plant or an ice factory. The motive of a contractor would have been the making of profit; the motive of the government is the furnishing the best possible service in order to secure the utmost efficiency of its employees. No greater care is taken

anywhere in the world to insure the wholesomeness of the food supply. No risk is run in the hope of saving money. The motive of profit hunger, which virtually everywhere else in the world is responsible for sophisticated food and drink, is entirely eliminated on the Canal Zone. No more instructive lesson has ever been given of the advantages of collective service over private service than

A STEAM SHOVEL AND CREW.
One of these powerful engines has removed 3,940 cubic yards of rock and earth in one day.

here. That there are faults to be remedied—particularly in the matter of the monotony of the meal service—is conceded. But the solid benefits of the whole scheme stand out in the strongest relief against the waste, the inefficiency, the expensiveness and the swindling of private service generally.

In a previous article I said that labor conditions in the Zone were, on the whole, satisfactory. Certain exceptions were made, and some further consideration of the subject may be given here. In May and June, 1908, a commission, composed of James B. Reynolds, Samuel B. Donnelly and Henry Beach Needham,

visited the Isthmus, investigated conditions, and later submitted a report, which was published as Senate document No. 539 of the Sixtieth Congress. This commission found conditions on the whole excellent, but submitted a number of recommendations for further improvements. These recommendations called for more efficient supervision of quarters, an increase in the number of drying rooms for bachelor quarters, the extermination of vermin, the wire-screening of quarters, the revision of wage schedules, the redressing of the grievances of the telegraphers, the application of longevity pay to all American employees receiving less than \$5,000 a year, the granting of vacation privileges on equal terms to all "gold" employees, the appointment of a

labor secretary, and a more uniform system of compensation for injuries. Some further recommendations were made in regard to the food service, increased provision of quarters for married people, and an increase in the number of club houses.

Some of these recommendations have been adopted in greater or less degree. Others have received not the slightest attention. The telegraphers, for instance, are in the same position they were in a year ago, if not worse. They work long hours, Sundays often included, and such of them as are not American citizens get no vacations. The telegraphers have no union, and their complaints have so far been pigeonholed without attention.

Nor has any change been made in the

FILLING IN SWAMPS AT LA BOCA

The rock and earth from Culebra have been advantageously used to reclaim a considerable area of land at the Pacific terminal of the Canal.

matter of withholding vacations with pay from "hourly" men. This is one of the points upon which Mr. Reynolds's commission laid particular stress. The "hourly" men receive price and a half for overtime, on the basis of an eight-hour day. Some of the "monthly" men receive an extension of vacation for overtime, professedly on the basis of an eight-hour day, but generally on the basis of a nine-hour day. Mr. Reynolds investigated the matter of the overtime received by the "hourly" men to find if it would equal or approximate the sum they would receive for a six-weeks' vacation with pay. He found that the cost of giving such vacations to all "hourly" men would approximate \$236,000, whereas the amount earned by them as overtime approximated only \$94,000. Their paid overtime was thus in but a small degree comparable to the money value of a six-weeks' vacation with pay. This matter is one over which an increasing

agitation is being made. The "hourly" men insist that they shall be treated as the "monthly" men, and have formed a sort of trades council to push their case before the Canal Commission.

Just what Mr. Reynolds's commission meant by declaring that they "found the eight-hour law faithfully enforced in the entire service of the Isthmian Canal Commission," it would be difficult to say. Certainly this is not the opinion of the men themselves. Employee after employee will tell you that he works from nine to fourteen hours a day. This is particularly true of foremen, dredgemen, steam-shovel men, powder men and others on the "monthly" list. Some of them get an extension of vacation for their overtime, but many of them get nothing whatever for it. Unquestionably the eight-hour day is the rule; but the exceptions from it are many and notorious.

Some attempt has been made at the revision of the pay schedules. "Equaliza-

tion" the Canal Commission calls it; "reduction" the men call it. The subject is complex, and difficult of solution. The practice of hiring men and making individual rates of pay and afterward increasing or reducing pay upon purely individual bases has resulted in great confusion. Mr. Reynolds found 757 different rates of pay for "gold" employees, and 400 different rates for "silver" employees. Many of the men assert that in "equalizing" these rates the tendency has invariably been toward reduction. A table published in the *Canal Record* for March 17th of the present year shows that between July and December of last year reductions had been made in the payroll of "gold" employees to the amount of \$47,000 per month, or 6.53 per cent. of the total amount. The "silver" roll showed reductions of \$12,046 per month, and the statement is made that the total reductions would amount to \$712,000 per year. As the rolls showed a net loss of employees of only 497, it is evident that the decreased wage roll means a considerable reduction in the wages of individuals.

Mr. Reynolds's commission recommended that employees permanently disabled should be pensioned for the rest of their lives, and that the word "hazardous" used in the act of May 30th, 1908, to describe the nature of one's employment, should be omitted. The fact of injury should be held to be a proof of the hazard of the work. Neither recommendation has been adopted, tho the act of February 24th, 1909, grants increased discretion to the Canal Commission in treating cases of injury or disablement. The provisions are totally inadequate to meet the necessities of these cases.

The recommendation for the building of club houses at Gatun, Las Cascadas, Paraiso and Ancon has also failed of adoption. Plans have been prepared—indeed, they had been prepared before Mr. Reynolds's commission reported—but the buildings themselves are not visible. They are greatly needed. Means of recreation are limited enough, even to the employees stationed at Culebra, Cristobal, Empire and Gorgona, which already have club houses. To the others there is so little chance of wholesome entertainment, there is so complete a monot-

ony of existence, that the temptation to resort to the saloons and dance halls of the cities is often irresistible.

There is no lack of complaints on the part of the men. There are so many indeed that the secretary of the commission, Mr. Joseph B. Bishop, must needs devote a great deal of his time to receiving and considering them. No doubt many of them are trivial. There is something in the climate, something in the remoteness from home and the artificial mode of life that induces constant restiveness and fault-finding on the part of men of a certain temperament. But then again many of the complaints are well founded. An army régime must needs fail in many ways in interpreting the wishes and the standards of workingmen; and customs and practices which may seem reasonable to the officers may sometimes produce the utmost irritation among the men. Then, too, many of the employees are trade union men. They are used to the fine and delicate adjustments of relations between fellow workers which the unions and shop locals ordain, and they revolt against the more chaotic relations inevitable to the open shop. There are, moreover, vast differences in individual experiences in the work on the Zone. A trained and capable man may have had a run of ill fortune. He may have been kept from promotion thru the jealousy or dislike of a foreman or superintendent, and have seen less competent men advanced over his head. From the men's stories there must be many instances of this kind. And so one finds the greatest differences in the testimony of the workers. The members of a lodge of machinists which I attended expressed themselves as thoroughly satisfied with their treatment, except in the matter of vacation with pay. But, on the other hand, I found reasonable and competent men utterly dissatisfied. Favoritism, petty injustice, arbitrariness, they alleged and gave instances in proof. Such men give up their work after a time and leave the Zone in bitterness and disgust.

It is a little section cut off from the great workaday world—this Canal Zone. As you may find there representatives of most of the races of the world, so also may you find among its workers the most

varied individual experiences and the most opposed moods and types of character. You may find content and discontent, peace and unrest, hope and despondency, thrift and extravagance. But amid it all you will see a wonderful ex-

periment in organizing and marshaling an industrial army and in caring for it by collective service; and you will see one of the world's greatest undertakings going surely forward to successful completion.

Experiments in Co-operation

BY N. O. NELSON

HOUSING.

FROM co-operative retail storekeeping, which properly dates from 1844, there have grown a variety of co-operative businesses, all based on giving the profit not to capital, but to the patrons. It has spread into wholesaling, manufacturing, agricultural business, banking, and lastly into home building and town making.

Co-operative housing is quite different from building associations, which bunch the small investments of many and lend it to the individual members who will pay the largest premium or bonus for it.

This other is correctly called Co-operative Tenants' Association. A business corporation is formed with a substantial capital furnished by well-disposed people of means. For the amount paid in on the stock a suitable tract of easily accessible land is bought. An issue of bonds is authorized to be sold from time to time for construction and for public improvements. The tract is planned, improved and platted in lots.

Tenants are then invited, the tenant and directors agree on a plan and a rental rate, the tenant subscribes for an amount of stock and bonds equaling the cost of his house and the lot and his proportion of the public improvements. Every year he is charged with interest and repairs on his premises and his proportion of public expenses, he is credited with the rent he has paid—the excess is applied on a payment on his stock and bonds. When his holding of these is paid he has no further rent to pay, except his share of expenses. When all the land is built on and paid for the homes are free. It is properly arranged that the investing stock and bond holders relinquish their holdings *pro rata* or by lot as they are taken up by the tenants. The stock is subscribed at a moderate rate of interest by friendly investors. The bonds being safeguarded by the stock and by the assured improvements and occupancy, can be placed on the open market at the lowest rate. The land being bought in

quantity, unimproved, and the improvements and construction done on a wholesale scale, there is the utmost economy thruout. The tenant being charged with his own repairs, he will be careful. As all the tenants pay the public expenses, they will be careful to incur no unnecessary waste or expense.

Each tenant remains a tenant of the company, of which all the tenants are the owners, but his occupancy is secure, because each tenant is similarly located, and he could never be evicted except for non-payment of expenses (in effect, taxes) or by action of the corporation, which means at least a majority of his associates. He is perfectly safe in his tenure. Wage earners and families of small means thus get their homes by the profits on their rents, they get better surroundings and facilities because they are properly planned, and they get new houses in harmony with their own tastes and means.

GARDEN CITIES.

Yet another step in co-operation has been taken in making entire towns. They are called garden cities because they are planned to be beautiful, well ordered and the seat of all that constitutes good living. Mr. Howard wrote a book outlining a town which should be well planned, should contain factories,

public works, stores, schools, churches, auditorium and homes. He called the book and the plan—"Garden City." Many such plans have been published. Mr. Howard differed from his predecessors by making a practical plan and being practical himself. The book was published in England, co-operators and other public spirited Englishmen took it up, about a million dollars was raised, 3,000 acres were bought at Litchworth, 30 miles from London, the plan was drawn, improvements started and investors invited. The land is not sold, but leased. Capital gets its minimum rate of interest and has no further claim. Factories have been built, mostly co-operative. Houses are built by private owners, but also by tenants' co-operative companies. After a few years all will be paid for and the net income from the public utilities and from land rents will pay all the expenses. It will then be the cheapest and the best place in England to live in or do business in. Other garden cities are projected in Europe and America. A further modification will be to have the entire enterprise co-operative. Individual occupancy and tenure in home, co-operative ownership in the land, the public utilities and the businesses.

ST. LOUIS, MO.

The Aeronaut

BY GEORGE HERBERT CLARKE

PÆAN, sing pæan!
For I have made me wings;
No more the empyrean
Withstands my journeyings;—
The empyrean,
Eternal, silent, vast!
I enter it at last,
And the god in me sings.

Power, sing power!
For I am greater grown;
This is the mighty hour
When *all* becomes mine own;—
The mighty hour
Dreamed, labored for, fulfilled,
Won as my spirit willed,—
The firmament known.

Yet, in the singing,
Hearken a low, sweet cry:
"Wouldst thou, O man, be winging
The stretches of the sky;—
Wouldst thou be winging
Thine ever-upward way?
Did not Love smile and say:
'Thy courier I!'"

PEABODY COLLEGE, NASHVILLE, TENN

Books of Travel

In the spring the American's fancies lightly turn to thoughts of travel abroad. With a continent of his own to roam in—and he does become more truly its child from year to year—he yet, owing, no doubt, to the cultural associations of his educative period, has his longing for older countries which must be gratified sooner or later, the “sooner” often meaning familiarity with Switzerland or the Land of the Midnight Sun before he goes to marvel at the grandeur of the Yellowstone or Selkirks. And when we say “he,” we mean mostly she, as is so generally the case nowadays in our social life.

So here is the usual crop of travel books, for the consolation of the stay-at-home, the guidance of the fortunate vacationist. From Mexico to China, from Spain to Finland, from Africa to Persia roam the authors of these books, living over again past delights, seeking to communicate them to others, or determined to instruct or have traveled in vain. All aboard! Non-passengers ashore! We are off with the tide.

Ex Africa semper aliquid novi. The old saw promises to be made true, indeed, in the season that is before us. Coming events have already cast their shadows before them in newspaper and magazine and book: from the editorial point of view everything African has been made new again by the expedition of the great hunter. One of his countrywomen seeks to stay our impatience for the jungle tales to come with a staid, informing account of a trip *From Cairo to the Cataract*.¹ Blanche Mabury Carson, its author, has invented, or perhaps she merely remembers, a professor from whose crude lips flow streams of lore, historical and other. She is, moreover, scrupulously honest in paying the tribute of the quotation mark to the many authorities she has consulted and relied on. A readable account of a familiar trip made annually by hundreds of our country-

women, more or less personally conducted by professors, parents, husbands, or the ubiquitous Mr. Cook. It is a handsome volume, illustrated, *çela va sans dire*, and boxed.

Farther East we travel into the awakening East. Mrs. M. E. Hume-Griffith's work is not, strictly speaking, a book of travel, but for that very reason of all the greater importance to the traveler, should one be found bold enough to venture into a country where the unrest of Young Islam is felt no less impellingly than in Turkey itself, where, too, reaction is dying hard. As the wife of a medical missionary, Mrs. Hume-Griffith saw much of life *Behind the Veil in Persia and Turkish Arabia*,² but her book deals with other things than the position of woman there—with religion, material conditions of life, its comforts and discomforts, the beauties of the land of the Sun much more than of the Lion, with manners, customs and superstitions, and the work of the medical missionary. A most informing book, readable withal.

While Major H. R. Davies, of the British Army, made his trips thru Yunnan for a purpose that is suggested³ in his subtitle, the advocacy, namely, of thru communication between British India and China, he yet furnishes a work of wider interest, in that a great part of the territory he traversed had been previously untrodden, even by missionaries, while much of the remainder had not previously been described. His book is elaborately provided with appendixes dealing with the various tribes of Western China, the climate, products, and prospects of the country, etc. A work primarily for the geographer, in so far as it is not a commercial survey for a railroad, but containing many pages of interest to the general reader, even tho perilous adventure be lacking.

FROM CAIRO TO THE CATARACT. By Blanche Mabury Carson.
New York: H. C. Platt & Co. 1909. \$4.00

Series has been added a volume on *Pisa*,⁴ by Janet Ross and Nelly Erichsen, the one dealing with the city's history, the other furnishing the description of the town as it is today, neither encroaching upon the other's domain, both sharing in the interest of the pictures. It is hardly necessary to add to the praise that has been awarded to this series since the appearance of the first volume. Its editor has the gift of selecting the contributors wisely and well.

An absence of all automobile talk—in fact, the motor is merely treated as a means of locomotion and nothing more—and a maximum of genuine appreciation of picturesqueness, beauty, and historical perspective, make Mrs. Rodolph Stowell's *Motor Tours in Wales and the Border Counties*⁵ far more than a mere guide book. This is a descriptive book of travel that will awaken a desire in the reader to follow the roads thro which it leads and that will leave in his mind a pleasant memory if the desire is never carried out. Historic ground, this, romantically historic ground, where England smiles in all her summer beauty.

Mr. A. MacCallum Scott's *Through Finland*⁶, having past thru two editions in England, will serve well as an introduction to one of the most interesting and beautiful regions of Europe for summer travel. Tho off "the beaten track," Finland offers ample comfort to the tourist; it is, indeed, likely that it will be discovered ere long as the "something new" for which the traveler is ever sighing. Mr. Scott is a practical, experienced guide; he is also an intelligent companion whose interests are wide and varied.

The mountain climber's realm has grown much larger since Leslie Stephen first published his *Playground of Europe*,⁷ nearly forty years ago. Those were the days of the glory of the Alpine Club, when Kilimanjaro, Mount Everest, and the high peaks of this con-

continent were yet beyond the ambition of its members, Mount Blanc, the Jungfrau and Rigi Kulm the objectives of their endeavor. Switzerland has lost caste somewhat among the world's mountaineers, her highest mountains long since conquered, her beauties somewhat conventionalized by familiarity, rendered less potent of spell by many tourists, and yet, one who rereads this book, after many years, understands the attraction it exerted on its first appearance. It remains one of the minor classics of its department of literature. Curiously enough, no American edition of this work by a writer who long since took his place in our libraries among the best that we honor in a common literature was ever published. Doubly welcome, then, is this first American edition, handsomely illustrated, clear and large of type, well-balanced of page. To those who have never seen Switzerland it will be a revelation of beauty and delight, a song of praise of the open, of healthful outdoor life spiced with danger.

Venice: Its Individual Growth from the Earliest Beginnings to the Fall of the Republic. By Pompeo Molmenti. Translated by Horatio F. Brown. Part III, Vols. I and II, The Decadence. Chicago: A. C. McClurg & Co. Price, per part, \$5.00, cloth; \$7.50, vellum.

When a certain Vicar of the Church of Rome, Chapter of Padua, said "he would regulate his conduct according to the inspiration of the Holy Spirit," and was answered from Venice that "the Holy Spirit had already inspired the Ten to hang the disobedient," he probably decided that the Republic, even in the throes of death, was still alive. The Ten in Venice ruled with power, elbowing off the papal interference on the one hand, while still politely answering the front door bell when reformers pulled the wire—and reforming but little. How poor a part the people played in the political performance shown to the world, after its private rehearsal in the secret conclave of the Ten, is told in Molmenti. Part III, now published in translation, covers the decline and fall of the renowned Republic. No better translator could be selected than Mr. Brown, whose knowledge of Venetian history has been

⁷THE PLAYGROUND OF EUROPE. By Leslie Stephen. G. P. Putnam's Sons. 8vo. \$1.50.

proved on more than one occasion, and whose English rendering is of the best, even if it does include (p. 16) such a sentence as this: "The Republic continued . . . to judge criminous clerics and to guard jealously her rights in front of papal innovation." The unlearned reader, however, would have taken it as a kindness, if the many illustrative passages now given in Italian or French, had been translated in the footnotes. The Molmenti work abounds in pictures illuminating the text, but the text itself is not so much a clear and consecutive story of the memorable deeds of the Republic's declining days as it is a thesaurus of illustrative detail of its arts, its commerce, costumes, everyday glitter and show of life. The taste of the time had its peculiar demands. Thus, the Venetians "were not much addicted to the use of water for washing, and the ladies, after sponging their faces, covered their cheeks with rouge, which made them seem *vermigli come rose damascene*. They soaked their clothes, from their chemises to their gloves, in perfumes that scented the air three miles off. Toward the close of the Seicento the ladies began to cover the face with patches, which soon acquired a language of their own; a patch on the nose was known as the *sfrontata*; at the corner of the eye, *passionata*; on the lip or on the dimple, *civetta* and *galante*; near the eye, *irresistibile*; on the throat, *galante*; in the middle of the forehead, *maestosa*; at the corner of the mouth, *assassina*." A "colored handkerchief was used when the ladies adopted the fashion of taking snuff." Arcangela Tarabotti thought "high pattens" should be used, because "women should always be raised above the common level of the earth." Of course, all the genial vices flourished. The ballet was highly patronized; gambling was as open as . . . well, quite as open as it ought to be, and the Grand Opera was made fruitful of cash when it was decorated by artistic *Topalchensan* *hansu*. When an apple is rotten, it requires but a slight blow to detach it from the tree. Napoleon shook the Italian peninsular, and Venice fell in the same year in which Washington laid down his office as President of the new Republic of the United States.

Some Memories. By Robert Collyer. Boston: American Unitarian Association. \$1.25.

For those who are suffering from the kind of cerebral excitement induced by the general whirl of social, political and economic themes of the day, there is a very gentle and sweet rest-sure in Dr. Robert Collyer's volume. He has done his share of hammering at the sins of the community. In the anti-slavery days he was by no means silent. In the era of clash between North and South he did not avoid the field of blood. He never sought to escape the "rain of hell" by getting under the umbrella of the Church when it was better to face the storm. Always a lover of peace and its roses, however, he has come to be more so, since some one told him a few years ago that he was an octogenarian. Now, having just past his eighty-fifth birthday, and got into the halcyon stretch of Indian Summer, he has earned a right to linger in the gardens of the past, and join as much as he pleases in the anvil chorus of early-day song. Our octogenarian was fourteen when his mother counseled him to go forth on his own account to the small world of Ilkley, Fewston and Addingham, adding her customary homely advice: "Childer, no matter how poor you be, when you have to do for yourselves, don't *look* poor, and don't tell." It was then the brave anvil chorus began, at the Ilkley forge, "sax miles away over the moor." There he was bound to service for five years, getting therefor not our high-tariff wages, but only his "weekday shirts and leathern aprons," together with "house-room and food." As that seems to leave no shirt for Sunday, we must infer that the good mother supplied that, as mothers will. At any rate, he presently makes a good figure in the Methodist meeting-house; going over, after some years, to America, and by and by slipping on finer clothes, he gets into the best Unitarian company, which, in those years, revolved around the State House in Boston, but swung off as far as Chicago. He was even, in the course of time, invited to take Theodore Parker's pulpit in Brahminical Boston, but never saw the day when they seemed to him to need him so much as he was

needed in Chicago. But it was at the forge and in the homely Methodist chapel that he began that life in the double service of a working humanity, which has never ceased. A sweet, homely—that is, a homelike—picture of it all he makes in these twenty-odd *Memories*. Thousands have learned to love him, as they loved that earlier Boston preacher, Father Taylor, of whom Doctor Collyer has given so genial and true a sketch in another book.

The Analysis of Play Construction and Dramatic Principle. By W. S. Price. New York: Published by the author, 1440 Broadway. \$5.00.

The Appreciation of the Drama. By Charles H. Caffin. New York: Baker & Taylor Co. \$1.00.

In his very thick volume Mr. W. S. Price is authority for the statement that "the idea that one can be born a playwright is a monstrous lie and fraught with evil;" but it is safe to say that had we more born playwrights we would have less failures in the theater. Freytag's "Technique" on one hand, despite its antiqueness, and Price's "Technique" on the other hand, are not in themselves unwise books to read, but they will never make a dramatist. When we talk of introduction, development, climax, denouement, catastrophe, and motive, we are using terms which are neither constant, separate, definite nor discernible by themselves. The technique of the drama is mobile, distinctly plastic, facile; it is not riveted like iron girders, yet it must carry the firmness of unerring construction. Mr. Caffin's *The Appreciation of the Drama*, illustrated with pictures that have no direct bearing on the text, attempts to do for the theatergoer what, in other books, the same author accomplishes so adequately for painting. But the technique of the canvas is different from that of the stage: the human element actually enters the calculations of the theater; there is the warmth of actual movement, not of suggested movement. For the theatergoer to understand the mechanics of the stage is not essential, tho Mr. Caffin's book is somewhat of a guide in that direction. If the

dramatist falsifies life, the layman instinctively feels it; perhaps the so-called architectonics of the theater will enrich his appreciation of the drama; it will hardly make more unerring his dramatic sense of life. Mr. Caffin enters into an over-minute analysis of "Hedda Gabler;" he takes the current stage as represented by "Paid in Full," "The Great Divide," "The Servant in the House;" but he does not in any way show a deep knowledge of the theater or a wide knowledge of the theatrical situation.

One Immortality. By H. Fielding Hall. New York: The Macmillan Company. \$1.50.

Mr. Fielding Hall has left the Oriental studies with which his name has been associated, for the uncertain field of fiction. *One Immortality* is hardly a novel so much as a series of conversations on marriage, for which a voyage from Venice to India gives time and the needed opportunity. The people have a phonographic effect, as tho they were reeling out the record of the author's voice, a little thin and strange, and saying undisputed things in a metallic way. The philosophy, however, is often well-expressed, as a few sentences taken at random will show.

"He said we English were so insular that every one made friends except us; we live upon an island and we make islands of ourselves. . . . No one every understood himself. You might as well pull yourself from the river by catching your own hair. . . . In the great things of life never act until you must, until you cannot help it. . . . To make a friend is to give a little of your heart. . . . The desert makes one think. It has no boundaries. It lets thoughts go out into the world. . . . We take our homes within us. . . . True marriage does not mean there are no strains upon the unity, but that the unit can stand them."

Mr. Fielding is equipped with an unusual familiarity with Eastern habits of thought, and the young Indian girl's defense of the Oriental child-marriage gives an exotic answer to the questions the West is ever asking of the East. "Love is the lightning from the sky; marriage the fire built upon the hearth. You worship love—we honor marriage." It is a specious plea. Yet one remembers the degradation of woman in India,

and pauses to build up his ideal, which includes both worship of love and honor of marriage; the perfect union which refigures immortality.

Literary Notes

....Paul Elmer More, formerly literary editor of THE INDEPENDENT, has become editor of the *Nation* in succession to the late Hammond Lamont. Mr. More's reviews of books old and new collected in the six volumes of the "Shelburne Essays" have placed him in the front rank of American critics, and he is eminently fitted by temperament and training to fill the important position to which he has been appointed.

....An interesting post-Napoleonic document is Major W. E. Frye's *After Waterloo: Reminiscences of European Travel, 1811-1819*. The Major had an open mind and a discerning eye. He described well, and saw much, his liberal attitude in an era of Metternichian reaction being noticeable thruout. He saw what the French, under the "Tyrant," had achieved in Europe, and in this lies the historic interest of the book; but he writes well of music and the arts, and the social life of the countries he visited. (London: William Heineman, 8vo., 10s. net).

....The recent publication of Plato's *Republic*, in a new translation by Mr. A. D. Lindsay (Dutton, \$1.25), coincided most appropriately with the issue, in this country, of a modern English version of More's "Utopia," by Mr. Valerian Paget. Mr. Lindsay, who is a Fellow of Balliol College, Oxford, gives credit for the help he has found in the labors of his predecessors, and furnishes a piece of work altogether adequate to its popularizing mission. Mr. Paget's aim has been practically the same, that of making "More's Millennium," as he calls it, accessible to the general reader. (New York: John McBride Co., \$1.50).

....The following autograph album verse by Whittier from the library of E. S. Marsh, recently sold at Anderson's, shows at least ingenuity in rhyme:

As an independent soul in the world's host,
I write, I cannot well come to rest,
And the under the penmanship mine and word
The poem comes I have written
But I venture to hope, though spiders spin,
And frost will melt and waves steal in,
That the burning passion that held my time
Will never come the best of mine.
And that, snugly lodg'd in some maiden's chamber,
On a cushion of down, for a girl's pleasure,
Will bring me a home to find in any
Sweet to the heart of a man.

JOHN G. WHITTIER.

....*The Correspondent's Manual*. By William Hickox. Boston: Lothrop, Lee & Shepard Company. 10 cents. This little volume contains some practical all-around information of value to those entering the business world, especially the stenographer. It deals with the various technicalities of business correspondence. To make the author in the introductory note (as intended) to assist with the notes which

the beginner frequently falls unless warned against." But it makes no mention of some essential points in correspondence that confront the stenographer occasionally, and it could easily be made more useful and convenient.

....Transportation by water, which, in the present stage of our commercial and industrial development, is a necessary complement and not a rival of railroad transport, is dealt with exhaustively in by Mr. A. Barton Hepburn in his *Artificial Waterways and Commercial Development*. The author succeeds in making plain the importance of waterways to our national development, illustrating his text chiefly with examples taken from the influences of the neglect of New York State's canal system upon the commerce of New York City. Mr. Hepburn deals but briefly with the water transport of the great countries of Europe, tho he could have found an impressive text there in Germany and the German Government's alertness to its possibilities. (Macmillan, \$1.00).

....A useful companion for the commercial man is *Chamberlain's Principles of Business Law*, a compendium of the principles of law underlying ordinary business transactions. "The bulk of our law is not written in the statute books," says the author, "but is based upon the customs of business men. These customs are published in the written decisions of courts form the greater part of our common or unwritten law." The book deals with contracts, commercial paper, the employment of agents, etc., but not with legal procedure, methods of enforcing legal remedies, and so on. Its aim is not to turn the business man into a lawyer, but to give him a legal understanding of such transactions as he usually attends to without professional legal advice. (W. H. Anderson Co., \$2.50).

Pebbles

ONE of our young ladies was expecting a call from her beau. "Oh, this waiting is something terrible. I can't stand it. (To younger sister): "Go outside and ring the bell three or four times hard!"—*Woman's Home Companion*.

"Do you think that Miss Kidder was having fun with me?" asked Chawley.

"Well, old chap, give me the details," was Arthur's response.

"You see, I had my bull terrier with me, and I said to her, 'That dog knows as much as I do.' And she said, 'Don't you think \$4.50 was too much to pay for him?'"—*Cleveland Leader*.

"Sirl!" said the young woman, with what seemed to be indignation.

The young man looked embarrassed.

"Yes, I did kiss you," he admitted, "but I was impulsively insane."

"That means that a man would be a lunatic to kiss me?"

"Well, any man of discretion would be just crazy to kiss you."

This seemed to ease the strain, and no jury being present to muddle affairs a satisfactory verdict was reached.—*Philadelphia Ledger*.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848
One Year, \$2.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

Strikes of Public Employees

THE strike of the French postal employees, including telegraphers, calls attention to a most perplexing and ominous problem in the public service. Is it right for those who are servants of the State to strike, and should it be allowed?

The employees of the French postal service have been allowed to form unions and they have twice struck, the first time against the retention of a superior officer, and the second time because an assumed promise that he would be removed was not kept. In both cases the strike has been a failure, even tho in the last case the attempt was made to tie up all the federated industries of the country. The postal employees would not strike *en masse*, and the industries failed to make a full sympathetic response. The failure of these attempts no doubt greatly discredits the doctrine that a strike against the Government is legitimate, and yet it needs further settlement, for it is a new and very important question.

The first consideration that meets the student of the question is the parallel case of soldiers. They cannot strike; a strike is mutiny and punishable with

death. But are the relations to the State of military and civil employees the same? The work of soldiers is different from that of postal clerks, but both have their duties and wages fixed by the nation, and not by private capitalists. Then there are the police, also public servants; have they the right to strike? It is said that if the police were to strike it would endanger the public peace and safety. True, but that could hardly be more disturbing than was the stoppage of the postal and telegraph service for a day or two in Paris.

Let us take a simpler case. Would the President and his Cabinet have the right to strike in retaliation for some offensive act of Congress? Can the Senate strike to express its opposition to the President? Can the Justices of the Supreme Court strike to compel the increase of their salaries and refuse to settle cases brought to them? If the men under the Secretary of War or the Secretary of the Navy were to quit work they would expect to be court-martialed and perhaps shot; but would it be perfectly legitimate for those under the Secretary of the Treasury or the Postmaster-General to do the same thing?

That civil employees can properly form unions for mutual insurance or other peaceful benefits which do not injure the State is undoubted, but we fail to see how one who has accepted employment by the State, and under known conditions, said conditions being a part of national law, has the right to attack and injure the State for his personal advantage. There may be good reasons for a strike against an individual employer or corporation, for they have no right of rule; but the nation is final, supreme. There is no recourse against the rule of the nation but revolution, and revolution is war. As against the *law* of the nation there is but one recourse and that is the election of rulers who will change the law. Here is the final objection to a strike by either civil or military employees—that the conditions under which they have chosen to work are settled by the law of the nation. The people rule by law, and the people, whether employees or not, are required to submit until the law is changed.

This extraordinary and, we believe,

illegitimate strike of the postal employees in France opens a question which is giving no little concern to the advocates of that extreme socialism which would put all production and industry under the control of the State. In that case the State would have to fix the hours of work, the remuneration, and all the conditions. There would have to be the common workmen and their bosses. There would be apparent inequalities, even injustices. In the present socialistic post office the employees have struck because they do not like the overbearing ways of M. Simyan; why would not such strikes be multiplied were all forms of manufacture, transportation, business and trade ruled by the State? Would engineers, conductors and brakemen, working eight hours a day, lose their human nature and all be satisfied always with the conditions which the chosen rulers have allotted to them? If strikes can occur and be allowed in partial socialism, why should they not be multiplied in complete socialism? We cannot answer that question. We leave it to the advocates of the social revolution who are startled by the strange and new phenomenon that has appeared in Paris. Socialism as a theory is itself undergoing great modification. The Marxian socialism is not the socialism that is preached today. Perhaps these French troubles may require further modification of the theory. But under whatever form of socialism or individualism, the law of the nation must rule, and a strike against the rule of the nation cannot be endured, whether in the Army or the Post Office.

The Mohonk Conference

FOLLOWING the National Peace Congress of Chicago by a fortnight there came last week the Fifteenth Annual Mohonk Conference on International Arbitration. These two great and distinguished gatherings gave radical and at the same time practical expression to the most progressive peace thought of the country. They cannot fail to do much in spreading the gospel of peace throughout the land, and strengthening the Government at Washington, which we

have reason to know is preparing not only to maintain but to surpass the unparalleled peace achievements of the preceeding administration. With Mr. Taft in the Presidential chair, Mr. Knox at the head of the State Department, and Professor Scott as their technical adviser; with Mr. Root and Mr. Burton in the Senate, and Mr. Bartholdt in the House, our Government is at last in a position, if it cares to, to embark on a vast constructive peace crusade and take the lead in what is now fast becoming the greatest political issue of the age.

We discussed in our issue of two weeks ago the Chicago Conference, and especially commended its resolution calling upon the United States to take the initiative among the nations of the world in the movement for the limitation of armaments and, as a preliminary step to that end, asking President Taft to appoint an eminent commission whose report "should serve as a basis for the action of our delegates at the Third Hague Conference." The Mohonk Conference was no whit behind Chicago, for tho it was silent on the subject for the last two years, this year it boldly declared:

The clear logic of The Hague conventions prescribes the limitation and gradual reduction of the machinery of war by the nations parties to those conventions, corresponding to the development of the instrumentalities of law and justice for the settlement of international differences. The great armaments of the nations, whose intolerable burdens prompted the call to the First Hague Conference, have during the decade increased so portentously as to have now become, as recently declared by the British Foreign Secretary, a satire upon civilization. They fill the world with apprehension and alarm; they create an atmosphere unfavorable to the system of arbitration; and their drain upon the resources of the peoples has become so exhausting as to menace all national treasuries and disastrously check the social reforms and advances which the interests of humanity demand. It is the opinion of this Conference that the time has arrived for carrying into effect the strongly expressed desire of the two Peace Conferences at The Hague that the governments "examine the possibility of an agreement as to the limitation of armed forces by land and sea, and of war budgets" and address themselves to the serious study of this question. Accordingly we ask our Government to consider whether the peculiar position which it occupies among the nations does not afford it a special opportunity to lead the way toward making these weighty declarations, and of public and concerted action.

These resolutions, therefore, of the Chicago and Mohonk Conferences, attended not only by peace advocates, but by army and navy officials, governors of States, mayors of cities, Hague delegates, American and foreign diplomats, clergymen, lawyers, labor leaders, college presidents, etc., clearly "put it up" to Mr. Taft to take the initiative in the question of the limitation of armaments.

Indeed, nearly all the addresses harked back to this question. Mr. Bartholdt, who probably had more to do with the calling of the Second Hague Conference than any other man, made an eloquent plea that Mr. Taft take "a short cut to peace" by initiating a movement with England and Germany, whereby these three nations should plan together means for an ultimate international peace. As England, Germany and the United States are the three greatest powers of the world, and peace can scarcely prevail without their cordial co-operation and understanding, Mr. Bartholdt's plea should certainly receive the serious consideration of our Government.

Undoubtedly the most statesmanlike paper of the Conference was the opening address of Nicholas Murray Butler, the presiding officer. President Butler has now become one of the foremost peace workers in the United States. Unlike Professor Hershey, who told our readers last week that Germany was the chief menace to the peace of the world, President Butler held that England's insistence on the two-Power naval standard is the greatest present obstacle to the peace movement, and that the "irrational and emotional" outburst in England against Germany is due to Germany's relative rise and England's relative fall in world importance. While President Butler did not emphasize Germany's international delinquencies, as he perhaps might have done, it is a fact, as one of the other speakers pointed out, that Germany has never paid much attention to international law heretofore, but that now her scientists and publicists are beginning to give it their attention, and as soon as they have finished their work, the Government, as is the custom in Germany, will apply the principles formulated by the scientists, and then Germany will be as

progressive, internationally speaking, as England, France or the United States.

We have only space to mention, among the many excellent addresses, the admirable statement of the good relations between Japan and the United States by Mr. K. Midzuno, the Japanese Consul-General in New York; the spirited debate between Rev. Frederick Lynch, of New York, and Canon Henson, of Westminster Abbey, on Christianity and war, in which Canon Henson's eloquence did not suffice to conceal his somewhat pagan ethics from his brother ministers in the audience; and the account, by Mr. Nasmith, of Cornell, of the Cosmopolitan Club movement, which has now extended to some twenty of our universities and is soon to unite with the analogous student movement in Europe known as *Corda Fratres*. Admiral Stockton also told of the recent Naval Congress at London, which has established the rules for the International Prize Court. Professor Scott suggested that possibly the International High Court of Justice, which was also created by the Second Hague Conference, but which was not inaugurated because the delegates could not agree how the forty-four nations could choose the fifteen judges, might be brought into existence by simply endowing the International Prize Court with the powers of the International High Court of Justice. Such a solution, however, would be unfortunate, in our opinion, for the judges appointed to the International Prize Court would be chosen primarily for their knowledge of maritime law, while the questions to come before the International High Court of Justice would generally be of a far broader scope. We do not want the court which Elihu Burritt prophesied two generations ago would eventually become "the highest court of appeals this side of the bar of eternal justice" to consist for the most part of admirals and maritime lawyers.

In our editorial on last year's Mohonk Conference we said that out of these conferences have come most that is good in the Peace Movement in the United States, and that the three days spent together by the delegates on Mohonk Mountain, in as close an intimacy as on

shipboard, has engendered a spirit which year by year has radiated thruout the country and has had a profound effect upon the peace of the world. We repeat again that Mr. Smiley is now over eighty years old, and should be crowned with the Nobel Prize.

Zionism in Mesopotamia

ZIONISM seeks first Palestine as its natural and national aim, in the hope that once more there may arise a Jewish nation, to recover the land and the temple once lost under Nebuchadnezzar and again lost under Titus. But it does not seem a very fruitful soil for agriculture nor a very hopeful land for trade, and the Turkish Government has not given much encouragement to the scheme. Jerusalem belongs already to Moslems and Christians, and they will not easily give up their hold on the city which is holy also to them.

Hitherto Palestine has been the only part of the Turkish Empire where there seemed any chance for the Jews to settle, for it is only along the Syrian coast that European governments have held Moslem intolerance in check. But there is a new spirit in Islam, and Islam is learning, it would seem, to give liberty to those of other faiths. The days of massacre, we hope, have come to an end; and this is the reason why now, after considering plans for colonization in South America and South Africa and elsewhere, the Zionist organization appears to have settled on an active attempt to divert the Jewish emigration from Russia and Poland and Rumania to Mesopotamia.

The scheme seems wise and feasible. Mesopotamia is the old home, the second home of the Jews. There they were carried captive. There they multiplied and became wealthy and strong. There Daniel lived, and the three who were cast into the fiery furnace. By the rivers of Babylon the Jews hanged their harps on the willows, and there Ezekiel saw his mighty vision, by the river of Chebar.

There was the greatest of the schools of rabbis, and there the Babylonian Talmud was written, and there, in Baghdad, the

Jews are a considerable element to this day, with their bench of rabbis, their synagogues and schools. Historically Mesopotamia is, next to Palestine, the motherland of Judaism.

No less is it a region peculiarly open and fitted for settlement. It has almost no population, and yet is unsurpassed for fertility. Egypt has only its one Nile, but Mesopotamia has two rivers, the Tigris and the Euphrates, and the magnificent alluvial valley between them. It ought to be a garden, and yet it is a desert, not of sand, but of unused soil. Possibly there are a million people in the two vilayets of Baghdad and Busra, with 110,000 square miles, less than ten to the square mile, and these nearly all massed in the larger cities. One can ride all day over what was the Garden of Eden and will be again, and not see man or beast. Egypt, with less than 13,000 square miles, has a population of ten millions, and with improved irrigation will support as many more. Southern Mesopotamia, the two vilayets from the Zab to the Indian Ocean, could support five times as many. It has no uninhabitable wastes; its land is all fertile. It needs just two things to restore its population—a system of irrigation and good government. Before the Turk came it had government and irrigation; but the Turk has closed the canals and destroyed the people. It is believed that the Hirsch Committee, with its forty-five millions, will back the enterprise. We see no reason why they might not secure control of thousands of vacant square miles of waste, establish a system of irrigation, and settle a hundred thousand agricultural Jews on their own lands. They must succeed if they have peace and water. Peace is now hopeful and irrigation is easy. No engineering is needed. The land is practically level, and the Tigris a little higher than the bed of the Euphrates. A railroad will soon go to Baghdad, and will then be extended to India. Already there is a regular steamship line from Baghdad to Bombay. Even with imperfect government the railroad will bring travel and security. There is not on the face of the earth a more attractive spot to create a dense and progressive population.

But what are the drawbacks? They are not the lack of money, for there will be money in plenty if the scheme is once launched; and not Hirsch's money alone. The one and only danger that at present occurs to us, assuming that permission and terms can be agreed on with the Porte, is the possible hostile attitude of the Arabs in the scattered agricultural and nomadic tribes, so many of whom are of the fanatic Mohammedan Shiite sect. There are the famous holy places at Kerbela and Nedjef, where Persian pilgrims carry their dead for burial, and within whose mosques no infidel dares to step. It is possible that they might seriously object to the settlement of tens of thousands of Jews, and yet, by the selection of proper locations, and the general establishment of irrigation, that difficulty might be avoided. In a measure the colonies would protect themselves, and a system of irrigation, such as the Turkish Government ought to inaugurate, would of itself keep the agricultural Arabs busy. It would be the greatest boon to them, hardly less than the reform of the system of taxation. We expect that the next ten years will see the valley of these two ancient rivers opened to the settlement, commerce and travel of the world, and the era of magnificent prosperity again returned.

And the American Jews, who have been so cold toward the Zionism of Palestine, will warm their hearts toward colonization in Mesopotamia. There they will see hope of success apart from political aspirations. Their large generosity has been strained by the claims upon it of the flood of poor Jews who have escaped persecution in Russia and Rumania, and have made a crowded ghetto in New York. They would like to see them diverted into peaceful agricultural pursuits in the Old World, and not so very far from their old homes. There they might create their own institutions, develop their national learning, and show us what a community of Jews, unhampered by foreign influences, can produce. We would like to see a Jewish vilayet grow up somewhere in the old Jewish headquarters of Nehardea and Pumbeditha.

University Reform in England

It is interesting to see that, while the great universities of this country are undergoing a rapid process of readjustment to meet the new conditions of modern life, the universities of England are feeling the same pressure, altho they are less easily influenced by it. London University is in the hands of a parliamentary commission, and Oxford and Cambridge, under threat of one, are trying to reform themselves. The prospect is not encouraging. Oxford seems incapable of reform from the inside. The commissions of 1850, 1872 and 1878 effected some changes, but much that they tried to do remains yet undone. The impediment is the system of alumni control, and this is the next worst thing to the dead hand of a testator. Even in this country the influence of the alumni in our older institutions is in a conservative direction, altho they have little or no official power. But in Oxford the Convocation, composed of some seven thousand masters and doctors, mostly non-resident of course, have the veto power, and at the January meeting they forbade the further discussion of constitutional changes. They were even, or especially, opposed to making M. A. Oxon. represent scholarship instead of being conferred on anybody who survives his college course seven years and can afford to pay a little money.

Lord Curzon, of Kedleston, on becoming chancellor of Oxford, first encountered a difficulty not unknown in this country. He says:

"As I have advanced further in the study of the subject it has been borne in upon me with increasing conviction that the cue to the majority of university problems and the condition of the majority of university reforms, is finance; that financial reform means financial control; and that until such control is established decisive progress cannot be made."

His further statement, that the accounts of the colleges are kept in such a defective and confused way that he cannot understand them, will be read with sympathy by any who have tried to compare the financial reports of American universities.

Lord Curzon's "memorandum" on Oxford reform, which has just been published, is a solid little volume of 200

pages, a [unclear] analysis of university conditions, with a few recommendations which seem to us quite moderate, but which are arousing heated and determined opposition. The most important of these are the reform of the finances; the reorganization of the governing bodies of the University, the Hebdomadal Council, the Congregation and the Convocation; the abolition of Responsions, or at least the dropping of compulsory Greek; a reduction in the number of classical scholarships and an increase in the modern branches; the addition of business courses; the establishment of a college for workingmen; the liberalizing of the theological faculty, and the granting of degrees to women.

As to the first, he finds that the total net income of the university is about a third of the total net income of the colleges. The colleges contribute a percentage of their net income, which means that the university gets a part of what happens to be left after a college has spent all it wants to on building and repairs. On the Greek question he says:

"One would-be benefactor of Oxford wrote to me that he was prepared to make a contribution of £30,000 toward a definite scientific object at Oxford, if I could assure him that the barrier of compulsory Greek would be removed. Tho my own sympathies were entirely with him, I was not in a position to give the assurance that he desired, and the fund still lacks this noble increment."

An American president would hardly attach so much importance to a prospective donation of \$150,000, and he certainly would not bring it forward so bluntly as an argument for a change in academic policy. But the *London Times* says: "Prejudice, and even reasoned opinion, will hardly remain unshaken in face of the statement" that such an offer had to be declined. The chancellor has succeeded in raising less than \$700,000 of the \$1,250,000 that he asked of the public, so the sum offered by this unnamed enemy of Greek doubtless seems larger to him than it does to us. The Greek requirement will undoubtedly be dropt before many years, so more interest attaches to his suggestion that responsions, which correspond to our entrance examinations, be done away with altogether. Lord Curzon would substi-

tute a system somewhat resembling that prevailing in our State universities, by which one examination should serve for leaving the secondary school and entering the university.

The suggestion that Nonconformists be allowed to hold professorships or examinerships in the theological faculty and laymen to take its degrees is provocation to wrath. The old idea that "Oxford is a university founded by Churchmen for Churchmen" is evidently not extinct. This restriction, which has kept out of the university one of the foremost theologians of England—Principal Fairbairn, of Mansfield College, at Oxford—is held by many to be essential to the preservation of Oxford orthodoxy.

Lord Curzon is a violent anti-suffragist. "You may put up the shutters on the British Empire and write Ichabod over the gates of Whitehall" on the day when women are allowed to vote, he said last week. He is in favor of granting them degrees at Oxford, but would not allow them a vote in university affairs afterward, drawing the following distinction:

"To give a woman a degree is to enable her to obtain the reward of her industry or her learning. As such, it is an extension of private liberty. To give her a vote is to give her the right to govern others, and is the imposition of a public duty."

This would be only a slight alleviation of the illogicality of the present position of women at Oxford. Now a woman can work at Oxford, but is given no credit for it. Lord Curzon would give her credit for her learning, but not allow her to make use of it in an administrative capacity.

We wish Chancellor Curzon all success with such modest reforms as he advocates, but we fear that before long he will wish himself back in India with a more peaceable and less discordant population under his authority. As an illustration of the position of the "stand-patters" we will quote a paragraph from the *Church Times*:

"A favorite argument for the abolition of Greek at Oxford and Cambridge is the precedent set by the Universities of London, Birmingham, Liverpool, and the like. Which resembles the argument that because the new countries in the empire have lowered the

standard of the marriage laws, the mother country ought to follow suit. We rather hold that it is for Oxford and Cambridge to glory in the fact that, in their history and their traditions, they are unlike the newer institutions which have been created for special needs; in a word, that they are just like Oxford and Cambridge—*sui generis*, unlike anything else in this world, and secretly envied and admired, if sometimes openly derided, by other nations."

In Cambridge the reform movement is proceeding on similar lines as at Oxford, but much more quietly and probably more effectively thru the work of committees. Committee No. 1 has just reported on the "Constitution of the Senate," advising a readjustment of the fees and the abolition of the practice of selling M. A.'s at a high price.

The University of London is growing at the rate of 9 per cent. a year. This year there are 3,925 internal students and 12,483 candidates for its examinations. The total number receiving degrees was 880. The recent progress and present needs of the university are thus summarized in two sentences by the new principal, Dr. H. A. Miers, in describing his first impressions in his address on Presentation Day, May 12th:

"While I was astonished to find how much had been done in some directions during the last eight years toward the organization of a teaching university—the incorporation of University College and the approaching incorporation of King's College, the administration of the Goldsmiths' College, the Laboratories of Physiology and Eugenics, the Goldsmiths' Library, the work of university extension, and the inspection and examination of secondary schools, the comprehensive series of approved courses, the intercollegiate and advanced lectures, added to the increase in the work of the external examinations, constitute in themselves a remarkable record for this brief period—while impressed by all this, I was at the same time struck by the appalling deficiencies which exist in some particulars. I found a university housed in the half of a building which, tho splendid, is entirely inadequate and bears another name, without any proper accommodation for its examinations, without even sufficient room for its normal business or for the meetings of its senate, councils, and committees; a university which sorely needs endowments and buildings for advanced teaching and research; which has no place that can become a center for the intellectual and social life of the teachers and students belonging to its numerous schools; a university mainly dependent upon examination fees for its existence, while compelled to consume one half of these fees in the expenses of the examinations themselves."

Democratic Senators and the Tariff

Prominent Democrats are saying that the course of

the Republican majority in Congress with respect to the tariff will give the House to the Democratic party at the next election. Some of them even profess to see Republican defeat in 1912 caused by the revision bill which is soon to be past. They deceive themselves. Since the beginning of this special session their party in Congress has not made a record that can induce the people, upon the sole issue of tariff revision, to transfer to it the power which the present majority has misused. After the Aldrich bill had been reported in the Senate, where there is every facility for thoro and searching discussion, the Senators of the Democratic party had a most inviting opportunity. They have failed to take advantage of it. Those who complain of this sham revision will not turn to them for help. They might have analyzed the provisions of the bill, pointed out the injustice of many of them, and exposed the open or hidden increases of rates. Good work of this kind has been done during the long debate, but very little of it has been done by Democrats. It was left for a few Republicans, and these, as a rule, have not opposed a reenactment of the present duties. The Democrats have been unable to agree upon a policy. At times they have assisted the leaders of the majority. Many of them have repudiated their national platform. If their party shall hereafter appeal to the people for support because of the enactment of this tariff revision by the Republicans, will it point to the record of its own representatives in the Senate?

George Meredith

In the death of George Meredith, on May 18th, the world is made the poorer by the loss of the last great creative force in English literature. He has been called the last of the great Victorians. He was such in point of time only; for while his earlier writings were contemporary with the best work of Thackeray, Dickens, George Eliot, Browning and Tennyson, to the very end of his fourscore years and one

this novelist, poet, critic, philosopher, moralist and teacher was in advance of his age. To the very end he maintained the liveliest interest in the great problems of life, civilization, human advancement. In his long and brilliant career he had published some twenty-five books, prose and verse, and had taken such a grip on the life of his time as few authors of any age have been able to do. In his novels alone he endowed with the breath of life more than a thousand characters. In his poetry he embodied, as no other poet or group of poets has succeeded in doing, the ethical concept of the law of evolution. George Meredith exerted a great influence on the work of novelists, poets, essayists younger than himself, but he has not yet come into his own with the vast mass of the reading public. His great and multiform activity tended to obscure the single-mindedness of his impulse; but it was that single-mindedness that gave him his rare power. His whole career was a demonstration of the great practical efficiency of persistent idealism. While the English language lasts the best of his work will live.

U. S. A. The Union of South Africa seems in a fair way to be established. The convention at Bloemfontein, in a session of only ten days, came to an agreement on a revised draft of a constitution which will undoubtedly pass the four parliaments. Then General Botha, erstwhile England's stoutest foe, will have the honor of presenting to the Imperial Parliament the document that makes a new and united nation out of the warring races. The proposed constitution, like our own, is not the ideal, but the result of innumerable compromises of conflicting interests. The finest thing about the agreement is the way in which Boer and British, Afrikaners and Rand magnates, have joined hands to found a new nation—a land liberal enough to give reason for them all to live together in peace and prosperity. It is a triumphant vindication of the policy of the Liberal Government, which, in spite of denunciations and evil prophecies of the Opposition, granted self-government to the

Transvaal and the Orange River Colony just as soon as the smoke of battle had cleared away.

"Ichabod" Baron Curzon, with the experience of an American wife, in a speech in the House of Lords last week declared the woman suffrage movement the most important subject in contemporary politics, and said that the enfranchisement of women would endanger the safety of the empire:

'The day 20,000,000 male and female voters are added to the register by the adoption of the system of adult suffrage, you may put up the shutters of the British Empire and write 'Ichabod' over the gates of Whitehall.'

Great Britain seems to be going straight to the bow-wows. Mr. Balfour is sure that Germany is almost ready to invade England, and its fleet can do it. Earl Roberts declares it has no army and cannot protect itself against an invading army. Another distinguished authority warns Britons that an enemy with half a dozen air-ships can blow London to fragments; and, worse than all this, Baron Curzon tells us woman's suffrage is a yet greater danger. We should like to know where he finds those 20,000,000 additional male and female voters, with a total population by the last census of 41,976,827, of whom 7,266,708 were already voters in 1906. In order to save the country it might be well to put the empire in commission under Roberts, Curzon and Balfour, with Kitchener, who comes back from India, as the head of the army and navy.

A Kiss for the French Flag On May 8th, the city of Orleans was *en fête* in honor of the newly beatified Joan of Arc. At ten o'clock there was a church celebration and also a military parade—Church and state for the nonce in union. The Freemasons and other societies had also a procession. Peace and sunshine pervaded the whole day and its ceremonies. The Bishop of Orleans, Mgr. Touchet, sent a despatch to the Pope. He voiced the thanks of the devoted followers of the Maid of Domremy to the Holy Father because

he kissed the tri-couleur of France when he beatified Joan. In response, Cardinal Del Val sent the Papal blessing to the cardinals, archbishops, bishops, all the faithful and the pilgrims. The previous kiss of the French flag, and a prayer that the Maid "may be the guardian angel of France," were the forms of the Papal blessing for the rebellious republic.

College Not Wanted

Berea College, thanks to Mr. Carnegie and other generous friends, has raised the \$400,000 needed to start a negro college in Eastern Kentucky to provide for the pupils whom the Kentucky Legislature has forbidden to go to school with the white youth at Berea. But where shall the new school be located?—that is the question. The negro population in Eastern Kentucky is sparse, and there is not universal good will on the part of the whites toward those that there are. At Benson, near Frankfort, the night-riders have warned the resident negroes to leave within forty-eight hours, on threat of death. A committee for the college went to Shelby County to inspect a site for the proposed Lincoln Institute, as it is to be called—not college—and they were warned away, and given, as a gentle hint, a bundle of switches and a hemp rope; and this altho they had been promised that the students should be kept on their own grounds and have their separate railroad station and post office. Possibly there are other more progressive places that might offer the location and a money grant in view of the trade that would follow, and the benefit to the few negroes that are thereabouts. Do they prefer worthless negroes to thrifty and intelligent ones? It is quite a slump from the equal opportunities which negro pupils used to have with the white pupils in Berea College to a separate industrial institute, with the students limited to a separate reservation and given a separate post office and railway station. Such is the *descensus Averni*.

Sensible Protestants have no reason to feel any jealousy at the approaching meeting in Washington of a Congress of Catholic Missionaries, at which it is ex-

pected that five hundred missionaries will attend. They are the men who most profoundly believe in Christianity, and in their form of it. To be sure they are not foreign missionaries, but those who have conducted missions in this country, mostly to their own people, but in part to Protestants. That Catholics should be made good and faithful Catholics is to be desired by all of us; and that there should be discussion of the differences between the two forms of Christianity ought not to alarm any one who believes his faith is based on reason. The members of the Congress will be mostly members of the religious orders, such as the Josephites, the Norbertines, the Lazarists, the Sulpicians, the Benedictines, the Paulists and the Jesuits. And here we may mention that the Jesuits have lately started an admirable weekly paper in this city, called *America*.

The Georgia railroads are all tied up by a strike, and Governor Hoke Smith declares he cannot protect them from violence, as there are not soldiers enough to guard the lines. The white firemen have a union, and the strike is to shut out from service all negro firemen. In other Southern States negro firemen are employed, but in Georgia the object appears to be to exclude them absolutely on the ground of defense against negro supremacy. And yet white firemen receive a larger wage than negroes, and only white firemen are eligible to promotion as engineers. This is simply one of the vicious methods, North and South, to keep negroes out of employment by monopolizing the business. We may hold Governor Smith in good part responsible, for his election was on the platform of negro exclusion from political equality.

The Senate has put the duty on imported automobiles, bicycles and motorcycles at 50 per cent., and the chief argument for the heavy duty seems to have come from Mr. Bailey, Democrat, of Texas, and from two Republicans, Hale, of Maine, and Heyburn, of Idaho, who curst the automobile like Balaam "from thence," and from the extremes pretty

far thence they came. They would have the automobile taxed out of existence. That is a position unworthy of intelligent men. It is of no use to fight the automobile; it is useful, a step in progress, and only needs to be civilized and controlled. If it damages the roads, then make better roads. If you don't like it, then learn to make the best of the inevitable, like other things which we can't live either with or without.

Two proud nations, France and Germany, agreed to submit their serious difficulties as to the Casablanca incident to The Hague, and that international court has decided that Germany was in the wrong. The German Consul had no right to try to protect soldiers of German birth who had deserted from the French army. It will be a victory for the cause of arbitration if the German people loyally submit to a decision that goes against them directly, and is no compromise. If so great a nation as Germany can yield to an international court which decides against it, then any other nation can submit its differences to the same court and not feel humiliated if found in the wrong.

It is a pity, a great pity, that the bill which has past the second reading in the British House of Commons, to remove all religious disabilities whatever, whether bearing on the Coronation Oath, or the office of Lord Lieutenant of Ireland, or property held by Jesuits or other monastic orders, is not likely to become a law at the present session, as it is a private bill and not one of those presented by the Government. The Liberal Government, however, favors it. This vote assures us that in another session it will be sent to the Lords, where, as usual for good measures, its fate is doubtful.

The Established Church of Scotland and the United Free Church are discussing the possibility of coming together, and the position is not considered hopeless. The Established Church has issued an invitation to a conference on the basis that the negotiations must be "conducted with the sanction of the national ecclesiastical authorities."

ognition," and a report of a United Free Committee says that under modern conditions an interpretation of this principle might be accepted by both parties without prejudice to the views of either. "National recognition" might mean much or very little.

It has often been suggested by way of joke to tax bachelors. There is so much good argument for it that the Austrian Minister of Finance, finding it necessary to add new sources of revenue, has proposed a tax on bachelors, widowers and childless husbands. Men that support no family may very properly give additional support to the state and pay an additional fine for their neglect of social and public responsibilities.

It is unfortunately not always safe to believe what one sees in the newspapers. For example, Professor Todd, of Amherst College, does not expect to join with Professor Pickering, of Harvard Observatory, in a balloon trip next fall up ten miles in the sky to get messages from Mars. He says he simply spoke of it as a possible plan, but had no idea of trying it. But the idea itself is more amusing than practicable.

Henry George seems *redoubtable* in Mr. Lloyd-George, Chancellor of the British Exchequer, whose budget has so frightened the landed gentry. He adopts Henry George's designation of the "unearned increment in the value of land," and puts a tax of 20 per cent. on all future increments. But he does not do this to abolish poverty, but rather to curb wealth.

Next week's issue, dated June 3d, 1909, will be our sixteenth annual Vacation Number. It will be the largest issue of the year and will contain a sixteen-page form of illustrations, submitted by our readers in our vacation photograph contest. The issue will also contain a section devoted to letters and articles from our subscribers.

Life Insurance of a Man Legally Executed

THE United States Court of Appeals at Richmond, Va., has reached a final decision in a suit brought by the heirs of one J. Samuel McCue, former Mayor of Charlottesville, Va., to recover from the Northwestern Mutual Life Insurance Company of Milwaukee the insurance on a \$20,000 policy carried with the company by McCue, who was hanged at Charlottesville, Va., for the murder of his wife. The decision controverts the contention that the payment of insurance in such cases was against public policy. The gist of the present decision, reversing former verdicts, is that life insurance companies will hereafter be required to pay policies in cases where the policyholders have been legally executed.

THE Great American Life Insurance Company of St. Louis, Mo., which was incorporated on February 13th, 1908, under the laws of Missouri, with an authorized capital of \$500,000, sold its stock at a premium that gives the company an actual working capital of more than \$1,000,000. In arranging the details of its permanent organization some changes have taken place in its official staff, but that is all settled very satisfactorily now. The board of directors recently elected by the stockholders consists of Henry Miller, vice-president and general manager of the Wabash Railway Company; J. W. Perry, second vice-president National Bank of Commerce, St. Louis; August Schlafly, banker and capitalist; George P. Murrin, capitalist; Peter J. Doerr, cashier Lafayette Bank, St. Louis; Massey Wilson, ex-Attorney-General of the State of Alabama, and a member of the law firm of Tyson, Wilson & Martin, Montgomery, Ala.; William H. O'Brien, general counsel of the company, of Brownrigg, O'Brien & Mason, attorneys-at-law, St. Louis; John B. Christensen, organizer of the Southern Trust Company, and Samuel Quinn, ex-president of the company and professional life underwriter. The execu-

tive officers of the company are as follows: Hon. Massey Wilson, of Alabama, president; August Schlafly, first vice-president and chairman of the finance committee; G. B. Reynolds and W. Sherwood Doyle, vice-presidents; Beauford McKinney, secretary; P. J. Doerr, treasurer, and W. H. O'Brien, general counsel. The Great American paid its first death loss on May 1st.

As illustrating a kind of protection which fails to protect *The Insurance Press* relates the following:

A surveyor, while inspecting a building not long ago, found an alarm clock hidden behind some boxes. An examination disclosed the fact that the clock was the property of the night watchman, who used it to awaken him from his peaceful slumbers in time to prevent his breach of trust from being discovered. The close examination on the part of the inspector goes to show that a survey depends a great deal upon a man who makes it.

It will thus also be seen that there is a moral hazard even about watchmen. But most of us knew that before, anyway.

AN interview with Paderewski, as recently published in Europe and which has many earmarks of authenticity, credits him with the following:

"For years I had an insurance of \$25,000 on my fingers. A German company carried the policy, for which I paid in annual premiums about 400 marks. But after I split a finger nail in Australia, which cost the insuring company something like \$150 and later suffered a slight injury in a railroad wreck near Syracuse, N. Y., which cost them \$250 more, the Germans got what Americans call the 'cold foot' and canceled the policy."

WILLIAM DE M. HOOPER has disposed of his interest in *Assurance*, formerly jointly owned by him and William E. Underwood. The publication of the paper will continue, with Mr. Underwood as editor and sole owner.

It is a curious thing, but statistics show that insurance companies pay more money to people who are injured in the process of hanging pictures or taking stoves apart than they do to victims of railway collisions.

FINANCIAL

The Upward Movement

An increase of the wages of 35,000 steel workers was the most impressive of last week's indications of progress toward complete recovery. This increase (announced on the 17th, to take effect June 1) restores the rates paid by a majority of the independent companies before the recent reduction. It does not affect the employees of the great Corporation, for the good reason that their wages were not reduced. There is much evidence that this increase of pay is due to a growing demand for products of the furnaces and mills. It will be observed that these 35,000 men were informed that the companies would expect them to work full time during the coming six months. The price of pig iron is rising, the number of furnaces in operation was increased last week; the demand for building shapes of steel continued to be noticeably strong; prices of wire and nails were raised, and large orders for railway equipment, especially for locomotives, were reported. The improved condition of this important industry affected prices on the Stock Exchange where considerable advances were shown for the shares of several steel companies, the price of Steel Corporation common rising to 60 1/4, a new high record. The Calumet and Hecla Copper Company increased its quarterly dividend. Reports from the varied metal industries of Connecticut, notably those of the Naugatuck Valley, were highly favorable, pointing to an activity almost, if not quite, normal in the production of articles in general use. Clearing house exchanges outside of New York (as well as those in the city) have been showing large gains over those of last year, and railroad gross earnings indicate steadily increasing traffic.

Heavy sales for future delivery are reported in the dry goods trade. John Claflin (president of the H. B. Claflin Company), a recognized authority in this field, says that manufacturers who hung back and reduced output because they feared sharp changes in tariff rates are now going ahead, having been convinced that there will be little or no disturbance of the tariff duties. Because of their reduction of output, however,

surplus stocks have been consumed, and now, with increasing demand, "in some quarters merchants are sending orders which the wholesalers are unable to fill because they cannot get the goods from the factories."

A statement recently published shows that there are in the United States 151 banks or trust companies having deposits of \$10,000,000 or over, and that the largest gain in deposits since 1900 has been made by the First National Bank of Boston, from \$2,184,000 to \$54,835,000, or 2,410 per cent. It is an interesting coincidence that all of the three banks at the head of the list in gains are named "First," the second being the First Trust and Savings Bank of Chicago, 1,390 per cent., since its first statement in 1903; while the third is the First National Bank of Cleveland, showing an increase of 1,111 per cent. since 1900.

The trustees of the Central Trust Company, of this city, declared last week a special dividend of 200 per cent., and also voted to recommend an increase of the capital stock from \$1,000,000 to \$3,000,000, each stockholder to have the right to subscribe for two shares of the new stock, at \$100 per share, for each share of the old stock now held. If the increase is authorized by the stockholders—as, doubtless, it will be—each will receive by the special cash dividend enough to pay for his allotment of new stock, and if he shall decide not to take the stock he will have a valuable right to dispose of, as the present stock was quoted last week at \$2,800 bid. This dividend is the largest ever paid by a trust company in New York. The Central Trust Company began business in 1875 with a paid capital of \$1,000,000. It has distributed to its shareholders \$13,155,000 (exclusive of this special dividend), and has accumulated entirely from earnings a surplus of \$15,570,607. Its deposits were \$84,353,967 on April 28th (as shown by its response to the Bank Superintendent's call on that date), and its total resources \$101,776,824. Its president is James N. Wallace, who succeeded the late Frederick P. Olcott four years ago.

Survey of the World

The Tariff in the Senate

At the beginning of last week, in the Senate's tariff debate, the subject of discussion was the duties on lumber. On the 24th, after several hours had been given to speeches, Mr. McCumber's amendment, putting rough lumber on the free list, was lost by a vote of 25 to 56. Seventeen Democrats voted with 39 Republicans for the duties proposed by Mr. Aldrich and his committee, altho removal of the duty on lumber was demanded in last year's national Democratic platform. Those voting for free lumber were 15 Republicans and 10 Democrats. Among the speakers was Mr. Root, who argued for the preservation of the differential on dressed lumber, in the interest of planing mills situated near the Canadian boundary. On the 25th, the time was consumed by speeches. Mr. Beveridge quoted from the addresses made last year by Mr. Taft, pointing especially to his remarks at Cincinnati in September, as follows:

"The Dingley tariff has served the country well, but its rates have become generally excessive. They have become excessive because conditions have changed since its passage in 1896. Some of the rates are probably too low, owing also to the change of conditions, but on the whole the tariff ought to be lowered."

He insisted that the majority of the Republican Senators, and not the insurgent minority, were opposing the policy to which the party had been pledged. Mr. Shively criticised the provisions for maximum rates; Mr. Foster and Mr. McEnery (Democrats of Louisiana) supported the protective duties on sugar. On the following day, sugar and the sugar duties were the subjects of seven hours' talk. Not until the 27th was action taken upon the proposed amendments to the sugar schedule. Mr. Bris-

tow's, for the elimination of the Dutch standard in fixing the duties, was lost, 36 to 47. Eleven insurgent Republicans voted for it. Another amendment, to reduce the refiners' protection, was lost, 32 to 53. Unexpectedly, Mr. Bailey then offered his income tax amendment. Mr. Aldrich moved that consideration of it be postponed to June 10th, and this motion was carried, 50 to 32. Only six of the Republicans who are regarded as advocates of an income tax voted with Mr. Bailey. These were Messrs. Borah, Bristow, Clapp, Cummins, Dolliver and La Follette. It is still asserted that the Democratic and the Republican supporters of an income tax cannot agree as to a bill or concerning method of procedure. The sugar schedule, as proposed by the committee, was approved on the 28th, together with the tobacco duties and several of the duties on agricultural products. Mr. Stone, of Missouri, sharply attacked the committee because it had withheld an official statement concerning the wages paid in Germany. It appears that this statement was sent to the committee several weeks ago by the State Department. Mr. Bradley, of Kentucky, spoke in favor of a modification of the internal taxes on tobacco, asserting that the taxes in their present form enabled the Trust to oppress farmers and had been a cause of the night-rider outrages. At the end of the week, Mr. Root opposed the increase of the duty on barley, speaking in the interests of New York maltsters, who desire to use Canadian barley. When it was admitted that the duty had had the effect of transferring the malting industry in part from the East to the Northwest, he sharply criticised a policy that would take an established industry from one State and give

it to another. His motion, hostile to the increase, was lost, 28 to 48. All of the Republican insurgents except two voted for the higher rate. A debate upon the projected increase of the duty on lemons was begun, Mr. Root opposing the higher duty, and California supporting it. There has been some talk about holding night sessions, because so much remains to be done. Many think that the Senate cannot reach a final vote in less than five weeks. The provision for a new Customs Court will be vigorously opposed. It is estimated that the cost of the court would be \$250,000 a year, and testimony is offered from the bench that such a court is not needed. This is the opinion of Judge Lacombe, of the Federal Circuit Court in New York, who has sent to Senator Dolliver a statement designed to show that the existing Federal courts can easily dispose of all the cases which would be assigned to the proposed court.—Senator Bailey, just after adjournment on the 27th, attacked the correspondent of a New York newspaper in the corridor adjoining the Senate cham-

ber, using foul language and attempting to choke him. Several blows were exchanged before the two were separated by Senators and the guards. Mr. Bailey's anger had been excited by an article questioning his sincerity concerning an income tax and intimating that he had assisted Mr. Aldrich by dividing the forces that desire such a tax. Before the attack was made he was informed by the correspondent that the article was the work of another person, but the correspondent's remarks indicated that it had his approval.

✱

President Taft at Gettysburg

On Decoration Day President Taft spoke at the unveiling of a monument at Gettysburg in honor of the soldiers of the regular army who fell there. He reviewed the service of the regular army from the time when, in 1786, it consisted of but 84 men, the lack of such a force in the War of 1812, the great work done in the Civil War and immediately afterward in opening the

JUST AFTER WAGNER MADE THE BIG HIT

From left to right: President Taft, Secretary Knox, President Hayley and Charles F. Taft at baseball park yesterday, last month. President Taft considers this photograph, taken by F. C. Bragman, at Gettysburg, the best baseball picture he has ever seen.

West, and, finally, the services in the Spanish War, and said:

"The general purpose of Congress and the American people, if one can say there is a plan or purpose, is to have such a nucleus as a regular army that it may furnish a skeleton for rapid enlargement in times of war to a force ten or twenty times its size, and at the same time be an appropriate instrument for accomplishing the purpose of the Government in crises likely to arise other than a war.

"At West Point we have been able to prepare a body of professional soldiers, well trained to officer an army, and numerous enough at the opening of the Civil War to give able commanders to both sides of that internecine strife.

"All honor to the regular army of the United States. Never in its history has it had a stain upon its escutcheon. With no one to blow its trumpets, with no local feeling or pride to bring forth its merits, quietly and as befits a force organized to maintain civil institutions and subject always to the civil control, it has gone on doing the duty which it was its to do, accepting without a murmur the dangers of war, whether upon the trackless stretches of our Western frontier, exposed to arrows and the bullets of the Indians, or in the jungles and rice paddies of the Philippines, on the hills and in the valleys about Santiago in Cuba, or in the tremendous campaigns of the Civil War itself, and it has never failed to make a record of duty done that should satisfy the most exacting lover of his country."

Supreme Court Punishes a Sheriff

The Supreme Court at Washington on the 24th ult. declared that Sheriff John F. Shipp, Deputy Sheriff J. A. Gibson and four other residents of Hamilton County, Tenn., were guilty of contempt of the court and must be brought before the bar for sentence. In 1905 a negro named Johnson was tried for rape, convicted, and sentenced to death. The crime had been committed in or near Chattanooga. In response to the application of his counsel, the Supreme Court, on March 19, 1905, granted an appeal, or made a decision which had the effect of setting aside temporarily the judgment of the local court. Thereafter, Johnson was constructively in the custody of the Supreme Court. On the

evening following the announcement of the decision a mob attacked the jail, took Johnson out, and hanged him. As the result of an investigation by the Department of Justice, the Attorney-General formally accused the sheriff, his deputy and seventeen citizens of conspiring to commit this offense. Testimony was taken, and six of the accused were held to be guilty. It was not charged that the sheriff took part in the lynching. Chief Justice Fuller says, however, in his opinion, that "he not only made the work of the mob easy, but in effect aided and abetted it." The substance of the opinion is that the authorities, resenting the action of the Supreme Court, took no precautions to defend the prisoner against an attack that was clearly foreseen. Justices Peckham, White and McKenna dissented, and the first of these, in a written opinion, held that there was no evidence

to show that the accused men were guilty of conspiracy to permit the lynching of Johnson. The sheriff, he said, was being "held to a degree of responsibility far beyond any reasonable limit." Gibson, the deputy, was the only officer in the jail when Johnson was taken out. The four citizens found guilty took part, the Chief Justice says, in the lynching.

8

Labor Controversies

A strike which had excited much interest throughout the country, because it involved the race issue, was ended in Georgia on the 29th ult., owing mainly to pressure from Federal authorities. The service affected was that of the Georgia Railroad Company, and the controversy related to the employment of negro firemen. The company had in all about 100 firemen, of whom 60 were white. The negroes were not eligible to be made engineers, and their pay was less than that of the white firemen. But they gave good service and were in line of promotion for the best places that firemen could hold. Consequently, some of them were in the way of whites as the latter were rising to engineers' places. The strike was precipitated by the discharge of ten white firemen employed at terminals and the filling of their places with negroes. For more than a week the road was tied up. There was much disorder, but it was due to the white people living in towns along the line rather than to the striking white trainmen. Negro firemen were attacked and beaten. Governor Smith refused to protect the company with troops. The suspension of service caused great inconvenience in many towns and villages. Chairman Knapp, of the Interstate Commerce Commission, and Labor Commissioner Neill went to Georgia and strove to cause a settlement. On the 28th, there was a prospect that a few mail trains would be moved, but a riot and a brutal assault upon one of the negro firemen who was to be employed prevented fresh difficulties. Then the company and the strikers' leaders were informed it is said, that it would soon be necessary for the Federal Government to interfere; that an appeal to a Federal court would be

made, and that the court's orders would be enforced. This might require Federal troops. And so the strike was declared off. Concessions were made on each side, but the white employees appear to be victorious, on the whole. All the men returned to their old places, but it was agreed that there should no longer be negro firemen at terminal points, and that the discharged white firemen should be reinstated. Several questions were left to be settled by later agreement or by arbitration. One of these is whether the negro firemen shall be eliminated, and, if not, how many of them shall be employed. It is expected that the negroes will be gradually excluded. Nothing but their immediate exclusion, it is said, will satisfy the white people living along the company's lines. Some had feared that the controversy would provoke a race war and would affect the employment of negroes on other roads in the South.—In Philadelphia a strike of the street railway company's employees was ordered on the 29th, their demand for an increase of wages from 21 to 25 cents an hour having been refused. An increase to 22 cents had been given and was soon to take effect. There are about 6,000 employees, and at last reports half of them had quit work and two-thirds of the cars were not in use. There has been much disorder; non-union men have been dragged from cars and beaten, and the service has been checked by mobs. The company is in disfavor with the people, owing to recent action increasing the price of transportation.—In Chicago, on the 29th, at the end of a long trial, Martin B. Madden, president of the Building Trades Council, and two of his associates, were found guilty of conspiracy to extort money from employers for the discontinuance of strikes. The evidence showed that in one case \$1,000 was extorted.

9

Cuba's Financial Condition

It was recently reported, apparently upon good authority, that the finances of the new Government in Cuba were causing some anxiety in Washington. The budget, it was said, indicated extravagance and pointed to

expenditures considerably in excess of the revenues. The Cuban Minister at Washington asserts that the reports are unwarranted and that they are circulated by persons who desire to misrepresent the new Government. There has been published a long letter written by President Gomez to a friend in Washington. The substance of it is that the additions to the budget are due to expenses made obligatory by the American Administrations. Speaking of the obligations in question, he says:

"Said obligations were to be paid according to the decrees creating them, 'with the surplus money in the Treasury.' The surplus money was spent by the Provisional Government for other purposes which it believed equally necessary for the good of Cuba; but since the obligations remained what other remedy was there than to make provision for them in the coming budget? Suppose we don't? Would it not be said then that Cuba does not pay its legitimate debts and would not the same outcry be raised by the foreign contractors and other people who, in virtue of the Provisional Government's orders, have claims against our Treasury? It is no reflection against the Provisional Government to state these facts. But we must repel the gross injustice of laying on the Cuban Republic the blame for the increase in public expenses, when the present Government of Cuba has no responsibility whatever in that matter."

He is criticised for recommending that \$40,000 a year be appropriated for the expenses of General Loynaz del Castillo, whom he has appointed a special envoy authorized to visit all the countries of South and Central America. The annual cost of the new army will exceed \$2,000,000. Complaint is made by some persons because he has given to German or French manufacturers the contracts for rifles and artillery guns, without inviting bids from manufacturers in the United States, altho Cuba owes the United States several millions for the cost of intervention, and is about to ask that the existing treaty of commercial reciprocity be made more favorable to her interests.

Other Countries South of Us

There has been a revolutionary uprising in the northern part of Santo Domingo, under the direction of General Camacho, formerly Governor of Monte

Christi. On the 25th ult., the revolutionists were attacked by Government forces, who won a victory after three hours' fighting. Santo Domingo continues to pay about \$100,000 a month into the fund deposited in New York for the settlement of the republic's debts.—Revolutionists in Peru, led by Isaias Pierola, attacked the palace in Lima on the 29th, made President Liguia a prisoner and bore him to the public square, where his resignation was demanded. He was speedily rescued by Government troops, who dispersed the revolutionists and restored order. About one hundred persons were killed in the engagement. The army remained loyal, and the revolutionists appear to have had very little support from the people.—Seven Colombians who had been exiled and were residing in Panama were arrested by the Government there last week and expelled from the country. Three started for Chili and four sailed for New York. One of the men thus deported was implicated in the attempt to assassinate President Reyes three years ago. They deny that they were organizing a revolution, but say that they had opposed a ratification of the pending tripartite treaty.—Much dissatisfaction has been caused in Honduras, owing to President Davila's reduction of the salaries of all Government officials by one-half. The treasury is said to be almost empty by reason of the payments made on account of Nicaragua's claim of \$4,000,000 for expenses incurred by intervention at the time of the revolution which placed Davila in office.—Nicaragua has agreed that the Emery claim shall be submitted to arbitration. The protocol was signed at Washington last week. It provides for a tribunal of five. If the two representing the United States cannot agree with the two representing Nicaragua in selecting a fifth member, he is to be named by the King of England. Four months are allowed for a private settlement, and it is expected that one will be made. —Bubonic plague has appeared again at Caracas, where four cases have been found. The Venezuelan authorities give notice that there will be no attempt to conceal the presence of the disease there or in any other Venezuelan city.

The Two-Power Standard A debate took place in the House of Commons last week over the "two-power standard" which Prime Minister Asquith defined last November as a preponderance of 10 per cent. over the combined strength in capital ships of the two next strongest powers, whatever those Powers might be and wherever situated. Winston Churchill, president of the Board of Trade, and Reginald Kenna, First Lord of the Admiralty, said in recent speeches that the Government excepted the United States from consideration in maintaining the standard. The Unionists moved a resolution seeking to commit the House to an expression of alarm at any modification of the Premier's definition, eliciting in reply a statement from Mr. Asquith, who said the two-power standard was not an immutable truth, like the law of gravitation, beyond criticism or dispute, but merely an empirical generalization, a convenient rule of thumb applicable to conditions which prevailed for many years, altho it was impossible to say how much longer they would prevail. The United States could not be regarded as one of the Powers which have to be taken into account at present, altho the United States, if one counted vessels by noses alone, would come second among the navies of the world. It was impossible, for the reason given, to treat her ships for effective aggressive purposes as being in the same category with those of France, Germany and Austria. After criticism from the Conservative side the Government was supported by a vote of 272 to 106.—Prof. Goldwin Smith has broken in from Toronto in the discussion on the British budget discussion. He writes to *The Spectator* that the House of Lords has the right to discuss, amend or reject the budget bill, on the ground that it is not a mere financial bill, but also a political bill. He says:

"The budget measure is not merely financial but it plainly political in a socialistic or semi-socialistic line. The House of Lords is the second chamber, the only second chamber that the nation at present has, and it surely is not to be desired that a measure of great political moment should be passed by the vote of a single chamber. It is a condition of government

"I am not saying whether the measure is right or wrong, but only that it appears to me unquestionably to be not only financial but political. The nation at all events seems to want a little time to think."

—One of the wealthiest men in Great Britain died last week in England named Charles Morrison, at the age of ninety-two, of whom the public had never heard. He was a very quiet, retiring man, and lived very modestly, even economically, but was no miser, and gave generously to art, was a kind landlord and a collector of pictures. His estate is valued at from sixty to seventy-five million dollars, and will pay over twelve million dollars in death duties.

The End of the French Strike The French strike of postal employees against the Government has proved a failure. Early last week the chief trouble was at certain ports, notably Marseilles, where, notwithstanding the decision of the General Confederation of Labor against striking, the strike of sailors, stokers and stewards of the merchant service was still kept up, and eighteen steamships carrying mails were tied up, but a bill was signed by President Fallières allowing provisionally the mails to be carried by ships bearing foreign flags. In Paris the postal strike had ended, and a number of postal employees were dismissed on account of the prominent part they had taken in the strike. A proposal by a revolutionary Socialist member of the House of Deputies granting amnesty to the dismissed employees, was defeated by a vote of 338 to 241.—No little concern has been felt over the discovery of serious frauds and bribery in connection with supply of naval stores and construction. Further instances of defective material furnished by contractors have been discovered, and it has been learned that, under the administrations of M. Pelléan and M. Thomson, bribes were offered to inspectors, while defective plates on submarines endangered the lives of the crews of these vessels. The Delcasse Commission has asked the prosecution of M. Thomson, former Minister of Marine, and M. Dupont, his private secretary, for having withdrawn certain official reports concerning cases of bri-

bery when they left the ministry. — Special honor was given last week to Andrew Carnegie by the Sorbonne, otherwise the Council of the University of Paris, in a reception and the presentation of a gold medal in recognition of his gift three years ago founding the Curie scholarships. M. Liard, rector of the college, made the address, and Mr. Carnegie replied in English. He spoke of Pasteur as one of his heroes, and said that Napoleon had earned the gratitude of thinking men, not by his exploits in war, but by his reorganization of France after the Revolution and his establishment of the University of France. He was especially proud that America was now devoting much time to research, which meant the world's progress, and extolled the part France was playing in the international peace movement. "Contrast the building of warships destined for murderous destruction," he exclaimed, "with the Sorbonne's discoveries for peace." The United States and France would continue to stand side by side on this question, declared Mr. Carnegie, whatever happened. Meanwhile the fact became known, which Mr. Carnegie had hoped to keep concealed till after his departure the next day, that he had given a million dollars for a hero fund for France. A reception was given him by President Fallières, at which the latter mentioned that he was the son of a blacksmith. The beneficiaries of the fund included men and women pursuing peaceful vocations who perform heroic deeds in France or the territorial waters thereof, or the widows and other dependents of those killed in the performance of heroic acts. Doctors, nurses, sailors, railway men and police are especially mentioned. The fund is to be managed by a commission of twenty-five now being formed by Premier Clemenceau. Among those who have agreed to serve are the only living ex-President, Emil Loubet; two former Premiers, Léon Bourgeois and Alexandre Ribot; Abbé Lemire, a Catholic Deputy and specially interested in workingmen; Pastor Wagner, well known in America as the author of "The Simple Life," and Baron d'Estournelles de Constant, a Senator equally well known as an apostle of universal peace.

Papal Affairs

It was in 1881 that King Humbert, of Italy, made an official visit to Vienna, but the Austrian Emperor has never returned the visit, because his appearance in Rome to visit the King would be regarded as an offense to the Pope, who claims the right to be the ruler of Rome. The way the Protestant Emperor of Germany gets over the difficulty when he goes to Rome on a visit is, after calling on the King, to return to the German Embassy and then go to call on the Pope, the embassy being constructively foreign soil. As the Triple Alliance includes Austria and Italy, the refusal of the Austrian Emperor to return the visit of the Italian King is not conducive to treaty relations, and the German Emperor has tried to persuade Franz Josef to go to Rome, or, at least, to have the Archduke Franz Ferdinand to do so. But the Emperor of Austria, as a good Catholic, still refuses to do so, not being willing to offend the Pope. For the same reason he has declined the suggestion that he make his old age the excuse for not going so far as Rome, and that he consent to meet the King at a city on the confines of the Austrian territory. — A delegation of 900 union employees of the French railroads visited Rome and were received in a special audience by the Pope, to whom they presented an album signed by 45,000 members of the union. They were entertained at a banquet at which a number of their Italian comrades were present by invitation. But after the banquet the Italians assembled and expressed regret that they had accepted the invitation, thus offending the sentiments of a majority of the railway employees. — The Papal decree has been published founding a Pontifical University for Biblical Studies. This has been promised for several years, and was on the program with the prohibition against Modernism, to show that the Church was not opposed to genuine biblical study. — No progress has been made by the Italian police in the attempt to discover the assassins of the New York detective, Petrosino. — In the Chamber of Deputies Premier Giolitti attacked the Socialists, who had complained of the influence exercised by priests in the elections. He told them that it was their own fault. They

made violent attacks on the Church, and the priests in self defense had urged their flocks to vote against the anti-clerical candidates. He said that it was the bounden duty of Catholics as well as other citizens to exercise the suffrage. Indeed, any future reform bill, in his opinion, ought to compel every qualified voter to cast his ballot. It was grossly illiberal, he added, to denounce any section of the nation because it voted as it chose. The Government stood for complete liberty for all shades of opinion.

Movements in Turkey

Turkey remains the center of public anxiety, and the source of many unsubstantiated rumors. There came last week various disquieting news. A reactionary movement was reported from Adana, where the troops were said to be discontented, while the officials were complaining of the reduction of their salaries. Hitherto the non-payment of salaries has been under the old Government of frequent occurrence, and the officials depended on bribery and oppression for an income rather than on their salaries. It was declared that at Constantinople the people were indignant at the public execution of so many good Moslems, and were ready to rise in rebellion against the Young Turk rulers. There was further report of unrest in Albania, where leaders were in the mountains organizing resistance. This unrest is coupled with the visit of Shefket Pasha, the military leader of the Young Turks, to Salonika, where it was reported that he would proceed to disarm the people by force, if necessary. Another report has it that the presence of Abdul Hamid in a fortress in Salonika is an occasion of fear, and that he is to be removed to one of the Mediterranean islands, probably to Rhodes. Nevertheless, there have been no real outbreaks to bear out the pessimistic forecasts. The new Government made its declaration of policy last week to the Senate and Chamber of Deputies, and the latter body voted confidence by the vote of 190 to 5. The declaration deals with the massacres, and announced that the state of siege in Adana had been extended to Antioch and Mush, and that measures had been taken to prevent any repetition of the outrages. The guilty parties will be punished, and

any future attempts on the life and property of Christians will be suppressed by an armed force. It is officially declared that 130 Moslems and 95 non-Moslems have been arrested in connection with the massacres. A most extraordinary report comes from a German source that the sudden recall of the French Ambassador, M. Constans, and the Russian Ambassador, M. Zinovieff, from Constantinople was due to the discovery in the Yildiz Palace of records that Abdul Hamid had paid M. Constans \$10,000 monthly and M. Zinovieff \$5,000. The Cabinet, it is declared, forthwith informed the Paris and St. Petersburg governments, which ordered the recall of the Ambassadors. The payments were effected, it is said, thru Pangiri Bey, one of the directors of the Ottoman Bank, who recently disappeared. According to the correspondence, the archives also contained compromising letters and receipts for money signed by Kiamil Pasha, formerly Grand Vizier, which led to his arrest, and he asserts that evidence against Ferdi Pasha, Minister of the Interior, also was found, and that this started a violent agitation in favor of forcing him to retire from the Cabinet. Last week thirteen more men were publicly hanged, having been found guilty of complicity in the revolutionary outbreak of April 13. Almost too good to be true is the dispatch received by *The Jewish Morning Journal* from its correspondent in Constantinople, as follows:

"Ahmed Riza, president of the Turkish Parliament, visited today the Hacham-bashi, the spiritual head of the Jews in Turkey, and on behalf of the Turkish Government extended an invitation to the Jews of Russia and Rumania to emigrate to Turkey.

"As proof that Turkey was making the invitation in good faith Ahmed Riza informed the Hacham-bashi that the Government will abolish all restrictions against Jewish immigration, and what is still more significant, will confer full citizenship upon Jewish immigrants immediately upon arrival in this country."

This seems to bear out fully the reports on which we commented last week editorially that Turkey would allow a great Zionist emigration of Russian and Rumanian Jews to Mesopotamia. But a cabled dispatch reports Jacob H. Schiff as saying that he has not yet given his support to the scheme, which would require \$200,000,000 for a system of irrigation. Perhaps he means a complete scheme for all Mesopotamia.

A Fragment

BY JOHN GREENLEAF WHITTIER

[This fragment shows Whittier's work on a poem never finished. The manuscript is not perfectly legible, and some words are corrected.
S. T. PICKARD.]

ON his flushed brow the cool wind blew ;
The leaves dropped on him their tears of dew ;
The angels of God, in the pensive guise
Of flowers, beheld him with pitying eyes ;
The stream looked up, and the sky shone in
Crystal-clear on the man of sin.
Alone with Nature and God he went—
Alone with the Infinite Purity—
With a painful sense of the sad rebuke
Which Peter felt in the Master's look.
With a prayer for pardon which might not cease
Till he felt in his heart the answer of peace—

The Sociology of a Wolf Pack

BY WILLIAM J. LONG

AUTHOR OF "NORTHERN TRAILS," "SCHOOL OF THE WOODS," "BREWER PATCH PHILOSOPHY," ETC.

THREE times within a week I have heard evil men compared with wolves, to the great scandal of the latter. The Turks, who massacre whole villages of men, women and children, using religious zeal as a cloak to cover their greed for Armenian lands and money; the food speculators, who corner meat and wheat in Chicago, growing wealthy by cutting a slice from every poor man's loaf; the sugar barons, whom our fatherly Government makes wealthy beyond the dream of avarice by putting a duty on every man's necessity, and who show their gratitude to the aforesaid Government by cheating it to the extent of two or three extra millions—all these and many other types of our peculiarly human civilization are said to be governed by the ferocious instincts of four-footed beasts. I have heard such men denounced as wolves by ministers in their pulpits, by socialists at their open-air meetings, and by a score of editors of our best daily and weekly newspapers.

"Now let another," as Brother Foote

used to say in prayer meeting. So the naturalist also protests, not against massacres, and corners in wheat, and petty stealing of large sums—for in affairs of that kind, which call to high heaven for quick redress, we have altogether too much talk and altogether too little natural action—but against our persistent slandering of honest wolves, and especially against our misconception of the whole nature and instinct of animals. For years I have spent my winter vacations in studying the wolf packs of the Far North and I find nothing to warrant our comparing them with men who oppress their fellows. On the contrary, wolves do not steal from one another; they never kill one another, either quickly, like Turks, or by slow starvation, like the food speculators; neither do they kill weaker creatures indiscriminately, like our mighty hunters. And they never, even when hungry, attempt to corner the food supply for themselves. If a wolf, having killed a deer, which was more than he could eat, should attempt to

claim the whole carcass for himself, or to prevent other hungry wolves from feeding freely, there would be never a word or a growl uttered in protest; but his selfish claim for more than he needed would last just long enough for the nearest wolf to reach his throat—a short shrift, since the spring of a wolf is like a glint of light in its speed and certainty. In a word, wolves do not compete—they co-operate with one another; and their sociology, such as it is, is in many re-

leader. That position is always held by a female. In a natural state the packs of the North, containing usually from five to twenty wolves, are made up as follows: First in importance is the old mother wolf; she directs the pack, and her will is law on the rare occasions when she asserts herself emphatically. Second in importance are the cubs of this year—ignorant, frolicsome brutes, which would starve, or eat poisoned bait, or blunder into the nearest trap, if left to

Copyright, 1910, U. S. G. O.

WOLF TRACKS

Showing a winter track with footprints of a pack.

spects better than our own, since it rests upon natural and wholesome instincts.

First, in the matter of government, we have an idea, borrowed from the story writers, not from animals, that the leader of the pack is always a huge dog-wolf, who has gained control by his superior strength, fighting and killing off all who dared question his leadership. Nothing could be farther from the truth. As a matter of fact, the big, powerful dog-wolf, while he invariably helps to support his family, has very little to do with the control of the pack, and is never a

themselves. Next are the cubs of last year, full grown and powerful, which know how to hunt, but have not yet scattered to get families of their own, and which still follow the old mother and profit by her experience. Last in importance is the big dog-wolf; he is always near his pack, but he treats the youngsters with a kind of lofty disdain and never attempts to lead them. Whenever a wide ridge is to be driven, the old dog-wolf joins his pack and the whole band sweep over the hunting ground, spreading out like a fan, so that nothing can

escape; more often he ranges alone—especially when food is scarce and the pack is hungry—hunting in odd places with the stealthiness of a cat, and whenever he finds game he kills it and generally gives the food-call before he has taken the first mouthful himself.

Once, while following the fresh trail of a big dog-wolf in the early morning, I heard a commotion ahead and hurried along on snowshoes to find out what it was all about. The big wolf had jumped a buck, which tore down the ridge in mighty bounds and went flying across the frozen lake. After him came the wolf, not wasting energy in high jumps, like the deer, but shooting along close to the ice, making three jumps to the buck's two, and gaining at every jump. I afterward measured a dozen strides down the open ridge, and found that the buck averaged sixteen and the wolf eighteen feet to the jump. Half way across a little bay the wolf was close up to his game, and held his place for a dozen bounds, close at the deer's heels. When he saw his chance he shot in like a flash, caught the deer by a hind leg and threw him fairly by a mighty twist of his head and shoulders. The buck rolled completely over and was on his feet in a twinkling. He whirled on his enemy, rose and struck a powerful blow with his front hoofs; but the wolf jumped back out of danger. Then he crouched with hind feet well under him for a jump, his front paws straight forward, his head on one side keenly watching the buck, which snorted and stamped and struck, but made no charge. Tiring of his demonstration, the buck turned and ran, but was again overtaken and thrown the same way. As he rolled to his feet the wolf leaped over him, whirled and closed his jaws like a steel trap over the kidneys. With one terrific snap the buck's back was broken, and he lay helpless on the ice. The wolf opened the throat, drank a little, raised his head, gave a peculiar howl, then lay down quietly beside his game. It was all so startling, so utterly different from what I expected, that I stood bewildered under the fringe of trees, watching and wondering what it meant. A sudden motion across the lake caught my eye, and eight more wolves rolled out on the ice, running silent as shadows. They swept down on

the game, circled it once or twice, and began to eat. Not till they were all busy did the old dog-wolf join the feast, which from beginning to end, so far as I could see and hear, was as peaceable as a breakfast table. When they had satisfied their hunger the youngsters stretched, rolled, played a bit, then the whole pack trotted off to the woods, leaving their signals at every promiscuous stub to tell any other hungry wolves that they could find plenty of food by following the back trail.

Here on the open lake, and near to good cover, was an abundance of good meat, and I watched it for a week with unusual interest. Many other wood folk came to the feast—jays, ravens, chickadees, weasels, many foxes, one lynx and another pack of five wolves—but with the exception of a red squirrel, which always tried to scold everything else away while he was eating, I saw no evidence of quarreling, or of any modern, highly civilized attempt to corner the food supply. Indeed, that one animal should have more than he needs while another goes hungry is absolutely foreign to the life and all the instincts of nature.

The leader of each of these packs is, as I have said, a female—the old mother-wolf, which has less strength but more intelligence than the male, and which has learned to care for others as well as for herself. Sometimes, when food is scarce, several packs will unite to sweep a large territory more effectually. Apparently they have a leader, chosen or recognized in some way which I have never been able to understand, but the leader is invariably a mother-wolf. The same thing is noticeable among herds of deer, and the reason for it may be seen in summer, by any camper, on any lake or river in the northern woods. If you paddle silently up to a buck, and if he thinks himself unseen, he will generally sneak off to shelter, saying never a word as he goes. If you surprise a doe in the same place, she watches you closely until she is sure that you are an enemy, then, before she has taken the first jump for safety, she gives the harsh, whistling alarm cry, to tell every other deer within hearing that danger is afoot. And this undoubtedly suggests the natural reason for female leadership. The male is gen-

erally a selfish brute, which cares first of all for himself. The mother animal has learned by nature and experience to care for others also, and so at the head of every herd of deer or elk or caribou you will always find a mother animal. This is not a socialistic or sociological article; but a naturalist might reasonably suggest here that the evils of our competitive system will never be remedied until mothers, led by their natural instincts, shall have a larger share in our business and political organization.

It would seem that when a large pack of wolves, consisting of many different bands and individuals, unite to catch game in this intelligent, co-operative way, there must be more or less strife in the division of the spoils, especially when the game caught is not enough for all; but here again we are mistaken. No matter what pack or individual first scents or kills the game, it belongs to all alike, not only to the big hunting pack,

but to any other wolf that appears at the food call. And tho I have followed many wolf trails from dawn to twilight, I have yet to find the first trace of strife or division among them.

Once, at midnight, under the clear winter moon, I stood on a cliff overlooking a vast barren, listening to the hunger cry of wolves, which came ululating thru the keen air from many directions. Suddenly far behind me, I heard the unmistakable food call, and presently saw shadows shooting across the open barren, all heading in the same direction. At daylight I followed the trails and found that one big wolf, hunting alone, had surprised and killed a young bull caribou. Game was scarce in that country, and three different hungry packs had come in to his call. From the stories we have read we would expect a bloody fight before the feast began, but nothing of the kind occurred. I judged from the tracks that between twenty and thirty

A WOLF RUNWAY

WOLF RUNWAY. The wolf, after killing the caribou, went on the trail of the next one, and the pack followed him. The wolf, after killing the caribou, went on the trail of the next one, and the pack followed him.

hungry wolves had fed peaceably from one small caribou, and after the bones were picked the three packs trailed off, each to its own hunting ground.

At another time I found where six wolves had surprised and rushed two beaver that were dragging fresh food-wood across a frozen lake. One beaver escaped into a refuge hole which he had kept open into a brook. The other was caught and eaten. He was hardly a mouthful for six hungry wolves, and all the crumbs they left of him were his big cutting teeth and a few bits of fur. But

sheepfold. As for hunting, that is not an instinct, but an invention. There is not a wild animal on earth that hunts for sport, or that kills indiscriminately, as we do. If they did there would not be a food animal left upon earth at the end of a single winter. Some of the weasels, apparently, are governed by a blood lust; but when we examine their stomachs we find them almost invariably afflicted with tapeworms and parasites, which probably produce a continual irritation and craving for blood; but even so, the weasels are an exception, and their destructive-

FOOD FOR ALL.

A lone wolf killed this buck and called in six others to join the feast.

there was no quarreling, and they played together after they had eaten. The record on the snow was perfectly plain.

As for killing weaker creatures indiscriminately, we have a ferocious idea of the wolves, gained partly from our heroic Nimrods, who assert that hunting is an instinct inherited from our animal ancestors, and partly from a wolf's terrible destructiveness when he gets into a

ness is never copied among the higher orders of animals. We have trained our dogs to our own destructive standards, and have spoiled the natural instincts of our cats, so that they frequently kill when not hungry. We call such destructiveness natural savagery; but, as a matter of fact, it is simply the result of civilization, which has changed or destroyed the natural instincts.

The wolf, like all other purely natural animals, hunts only for food, takes the first thing which satisfies his hunger, and then lets all other animals severely alone. One day last March I followed the trail of eight wolves for a distance of at least ten miles. They had gone thru swamps where rabbits, their natural food, were plentiful; they had past thru three deer yards, one of which contained a dozen animals, and had jumped two deer so close that they must have heard or smelled them; but they had not chased or hunted a single animal. And the explanation lay at the other end of the trail. They had killed a buck that morning, had eaten what they wanted, and were now minding their own business, as all other wild animals do.

At another time, two years ago, in winter, I found a small pack hunting, and eagerly followed their trail. There were five wolves, and they had spread out widely so as to sweep a deer yard which lay on the south slope of a densely wooded ridge. Three different deer were jumped and chased a short distance, but tho the wolves could easily have caught and killed all three, they suddenly left the trail and ran down into a valley. There the big dog-wolf, hunting by himself, had jumped a deer and had probably given the hunting call. He was following at the deer's heels in deep snow, which hampered him, and the pack instantly divided, running on either side until they headed the deer and killed him. Then they ate and roamed off thru the big woods, paying no attention whatever to the three other deer which they had just been chasing.

As for killing many sheep when he gets a chance, that charge must stand against the wolf; but there is a good reason for it. The domestic sheep is a very foolish animal, which by association with men has lost many of its instincts and all of its natural cunning. Wild sheep or deer, when attacked by wolves, instantly scatter, and the wolf, following his natural ways, chases and kills one and pays no heed to the others. When a wolf gets into a sheep pasture everything is instantly changed, and the wolf is thrown off his natural balance. The sheep crowd together, running helter skelter without aim or method, and their squalling and crowding and general fool-

ishness gets upon the nerves of any animal. Even the best trained dog will often forget his training and take after sheep at such a moment, killing a few, because it offers him a new and exciting exercise. Now, a wolf is exactly like a dog in this respect, that whenever anything bolts off under his nose he cannot help chasing it. A pack of wolves has been known to chase a railroad train, and once, on a branch of the Grand Trunk Railroad, we had a thrilling story of passengers pursued by a pack of ferocious wolves. As a matter of fact, these were undoubtedly young wolves roaming by themselves at the season when the old wolves had left them to beget other families; and these young, frolicsome brutes, seeing a train rushing by and not knowing what it was, had rushed after it headlong—exactly as your dog bolts after a chicken that goes squawking out unexpectedly from under his nose. When a wolf gets among a flock of sheep, the foolish, crowding animals confuse and excite him. He kills one, and, in a natural state, would stop right there and satisfy his hunger and then go away; but hardly has he thrown one sheep when another bolts under his nose making him forget his hunger and what he came for. So he chases and throws and kills till he tires of the exercise, or till the sheep break away into the woods; whereupon he instantly goes back to first principles *i. e.*, to kill only when you are hungry, and to leave all other animals to live their life in their own way. And that is all there is to sheep killing. It is neither a blood lust nor a ferocious instinct, but just a bit of wild wolf-play under unnatural excitement.

Occasionally, but very rarely, I think, the wolves kill a wild animal when not hungry. A mother-wolf leading out her pack of young cubs, will set them to chasing anything, evidently to give them training; and when any wolf is prowling thru the woods and an animal bolts out from under his feet he invariably chases it a little way, just as a dog, when he sees a man suddenly start to run, invariably runs after him. In the winter time the snow leaves a plain trail, and by following it one may find exactly what the wolves have been doing. I have followed many such trails, telling the stories of scores of wolves at different times

and only once have I found an animal killed and left uneaten. This may have been killed in play, or else the wolf, led by his keen scent and marvelous instinct, had detected something wrong in his game and refused to touch it.

I have spoken of the wolves as co-operating with one another, and many of their ways suggest a curious sense of comradeship rather than of competition. Thus when a wolf is wounded or sick, the pack does not fall upon him and devour him, as we have been led to believe. Instead, they gather close about him, and one who watches gets the impression that they are trying to find out what is the matter. The wounded wolf breaks away out of the circle at last, trots away, then, when his wound pinches him, he raises his head and howls. Instantly the pack gather about him again, circling uneasily, sniffing in every direction for danger, and then nosing the sufferer or raising their heads to howl with him. So it goes on until, obeying the strong animal instinct at such times, the wounded wolf slips away to rest and nurse his injury. The pack seems to understand, for they never follow the wounded one, but trot away to their own hunting. When the wounded wolf needs food, he seems to depend on his own pack. He rarely follows their trail, but in some strange way seems always to know where they are, and whenever he needs food will go straight across hill and valley to where they have killed and eaten and left plenty of food behind them. In the photograph which accompanies this article one may see where eight wolves gathered two or three times around a wounded comrade until he left them resolutely to seek shelter, when they all trotted off in the opposite direction and killed a deer on a ridge overlooking another lake, some two or three miles away.

Again, when two big dog-wolves meet in the hunger season, they do not fly at each other's throats, as we suppose, but salute in dog fashion and pass on. If both are ravenous, having hunted in vain alone, they put their heads together and trot off—side by side if the going is good, one after the other when the snow is deep and soft. I have found where

have scented a fox and, while one hid cunningly beside the trail, the other made a long detour and drove the fox back to his hunting companion. The same co-operation is especially noticeable when several wolves attempt to hunt a caribou. Now the caribou is fleet of foot, and nothing on earth can catch or tire him in a fair run. The wolves seem to know this perfectly, and hunt in relays. One or two take after the caribou, not pressing but turning him continually by running out at one side. When these wolves begin to tire others are waiting at certain places to take up the trail of the same caribou. So they follow him for hours, sometimes for days, till they get him just where they want him, when the wolves behind will suddenly make a terrific rush and drive him straight into a trap where other wolves are hiding and waiting for the kill. And, I repeat, there is no fighting over the spoils, but each takes what he needs and never questions the right of another wolf to his share of Nature's common mercies.

I do not mean to suggest or to imply that the wolves plan their own social system, or make game laws, or ponder the rights of others. They simply act together, following wholesome natural instincts of co-operation. And the result seems almost heavenly in the face of our own competitive methods. Looking at society from the viewpoint of a naturalist, I assert that it is most absurd for us to apply the adjective "wolfish" to men who cheat or oppress or slay their fellows. On the contrary, such men have nothing natural about them; they are the inevitable products of the unnatural competitive methods which we are all more or less blindly following. Instincts, I assert, are fundamentally right and good things. If men followed the instincts of wolves, or of any other highly developed animals, they would not violently compete, but co-operate; there would be no corners on the food supply, no stealing from the Government or from individuals, no massacres, no social vice, no game butchers, no poor men starving in the midst of plenty. These are all purely human inventions. They have no place in the natural sociology of the wolf pack.

The New Sport of the Aerial Navigator

BY AUGUSTUS POST

[Mr. Post has already contributed articles to THE INDEPENDENT on automobiling and aeronautics. He is now secretary of the Aero Club of America and has made many ascensions both in balloons and dirigibles, and has taken part in two of the most important international races.—EDITOR.]

PROFESSOR LANGLEY used to say that there were three stages in the development of a new thing: The first when every one says it is impractical and impossible; the second when they say the principle is sound, but it has been worked out wrong; and the last, when they say it always existed. We are fast arriving at this third stage in the development of aerial navigation, for tho it has not yet become so common as automobiling, nor can every one go in a flying machine, the idea is at least universal. As all magazine stories a few years ago had to have automobile plots to meet the popular interest, so aircrafts figure in the magazine fiction of today; records of progress in aerial navigation

furnish a constant flow of illustrated articles; posters and advertisements, and even the joke columns, have found a new source of supply. Indeed, the newspaper humorist seems to think that the flying machine is already part of the ordinary domestic equipment. Lawyers and militarists are considering problems of aerial rights, and the phrase *usque ad caelum* takes on a new meaning. Almost every day we read announcements of flying machine races and trips taken in all parts of the world, and even royalty is taking up the sport. The Crown Prince of Germany has navigated the "Zeppelin" over his father, the Emperor, while the Kings of Spain, Italy and England stand as spectators of the

THE LARGEST TYPE OF DIRIGIBLE BUILT FOR PRIVATE USE

THE MILITARY DIRIGIBLE "REPUBLIQUE" DEPARTING FOR CHAMPAIS

flights of the King of the Air, Mr. Wright. In brief, we have really entered upon the conquest of the air, and sailing above the earth has thus become a recognized sport.

At present balloon trips are most easily made in France. It is as simple as an automobile ride. You order the balloon inflated at a certain hour at the Aero Club Park or at one of the large balloon factories, step in and fly away with no more ado than when you board your yacht and set sail upon the sea. But what a difference! Far above the earth, above the clouds—with no breath of air to disturb the quiet coolness of the higher altitudes—one feels the vast peace of Nature's one uninvaded realm. No matter in what part of the world you may be, the regions of the upper air are the same, except for the slightly modified meteorological conditions and air currents. Tho the wonderful landscapes stretching far below may change; the weather may veer from calm to storm almost without warning, and clouds obscure the sun, or fog the earth; the air

sailor sees the country as no one else can. If you would sail from St. Louis to the Atlantic Coast, passing over the Middle States that look much alike, and the Alleghanies, with coke ovens burning at night like thousands of openings into the lower world, and then make an ascent from Berlin and fly across the level plains of France and over the Swiss Alps, you would have an unparalleled opportunity of comparing the physical character of Europe and the United States.

Balloon ascensions are much easier to make near New York than they formerly were, for the Aero Club of America has been now for several years organizing local clubs in the neighboring cities, with stations where balloons may be inflated, and pure coal gas, which is needed for the ordinary spherical balloon, bought. The cost is not excessive, considering that you need only a couple of weeks of preparation and anticipation of your pleasure, two or three days to accomplish the trip, and as long as you live to talk it over afterward.

No one can ever forget his first balloon trip, no matter how many may follow it. The sensation is indescribable when the ground seems to recede from you and your horizon gets larger and larger, until at the height of a mile you can see ninety-six miles in every direction, the houses look like stones and men like dots. The sound of dogs barking

There you see a good open field on an up slope, just the place. The pilot commands all hands to be ready to descend, and to "prepare to land," cautioning each passenger against getting out before the balloon is entirely deflated. Should one leave before the others, the balloon, lightened by so much weight, would shoot up into the air to a great

THE "SILVER DART" CARRYING MR. DOUGLAS MCCURDY AS AVIATOR
Baddeck, Nova Scotia, March 8, 1909.

or the cocks crowing come up from the misty depths below. They seem unfamiliar and out of keeping with the ethereal stillness of the upper air. Thunderstorms in the distance seem never to overtake you, for you go floating in the wind as rapidly as they. You realize that you are moving only when you see the shadow of the balloon on the ground, or watch the trail rope dancing along below, sometimes hitting the tops of trees, sometimes frightening chickens in its wake, sometimes, as once happened to me, catching a barbed wire fence and, before it pulled loose, dragging it across a cornfield and mowing down the shocks like a reaping machine. Now you look out for a good landing place, if possible not too far from a railroad station, so that there will not be too far a haul after the balloon is on the ground.

altitude, and it would be very difficult, without much ballast, to make a second landing. Now the drag-rope is already on the ground and the pilot is pulling the rope that opens the valve at the top of the balloon, so as to let the gas escape. You descend rapidly—at first it seems as tho the trees and fences were rushing up to meet you. All movable things having been securely packed, and instruments put into their cases, and all the heavy coats and covers placed ready to be thrown out if necessary, a little ballast is thrown out to check the speed of the descent. And now, within fifty feet of the ground, the pilot cuts loose the anchor rope, and the anchor falls, bounding along until it catches, and you feel the slight jerk of the tautening rope. Now you reach up and grasp the concentrating hoop above the basket, where the

rope attached to the bottom of the balloon has been securely tied to prevent the bottom shriveling up and forming a parachute. The basket touches the earth, and relieved of its weight the balloon rebounds a few feet; and then, after it touches earth the second time, the pilot, by a quick pull on the rip-cord, tears out the ripping-panel, and the gas instantly escapes, allowing the envelope to lie over on the ground to the windward side, no more the living, breathing, expanding and contracting, almost human creature that it was a moment ago, but a lifeless mass.

So much for the most exciting moment of your balloon trip; you have landed—usually among the farmers, not flitting by as the automobile takes you, but descending out of the sky straight into their lives.

Far more exciting is the operation of

ment you turn you are swept back over the ground you have already covered. The great problem in the dirigible is to prevent the pitching and diving so apt to occur, especially where the propelling power is applied at such a low point.

It may be well to look at the great progress made in the construction of the dirigible since the day of the first Santos-Dumont airship, hardly more than a toy in comparison with the great aerial Dreadnoughts of today. Our own military airship, purchased by the Government from Captain Thomas S. Baldwin, centered the attention of Americans upon the dirigible during its evolutions at Fort Myer last summer. The French people, who as a nation have given the most thought and time to the development of the airship, have evolved a type called the "Lebaudy," from the Lebaudy brothers, its builders. This is of a semi-

THE "SILVER DART" ALIGHTING.

a dirigible. Tho you are able to direct your course and return again to your starting point, balloon experience will stand you in good stead, for you are accustomed to the highs and to being in the air; but now you have the wind to deal with, and if it be a stiff breeze you must steer directly into it, for the mo-

rigid construction, the frame is not very large, and the envelope retains its form partly by the internal pressure of the gas. This ship and its sister ships, "La Patrie" and "La Republique," carry three or four passengers; the engineering arrangement was developed by M. Juillot, an engineer employed at the

ORVILLE WRIGHT AT FT. MYER, VA., ABOUT TO START ON AN AERIAL TRIP

brothers' sugar refinery at Paris, while the envelope and balloon work was by Surcouf. The success of the Lebaudy vessel was so pronounced that the Gov-

ernment itself took up the building of ships of this type and launched the "Patrie," the first Government airship, whose longest trip, made in 1907, from

ORVILLE WRIGHT, KATE WRIGHT AND WILBUR WRIGHT

They had traveled more miles by airplane than any other man or woman. Taken in Paris, the streets of New York on their return from France.

Paris to Verdun, covered 150 miles in 6 hours 45 minutes, with a strong cross wind. There being no adequate harbor at Verdun, and a violent storm suddenly arising, she was wrenched from her moorings, out of the hands of the soldiers trying to hold her ropes, and blew away. She past over England and Wales, and out into the Northern Atlantic Ocean.

In place of the lost "Patrie," M. Henri Deutsch de la Meurthe offered the Government his ship, the "Ville de Paris," built for his own pleasure on plans by Surcouf, who made the gasbag, while the mechanical parts were made at the Voisin shops. The military authorities

framework, in which at the forward end of the propeller is the engine and platform for the engineer, then the bridge or pilot's platform containing the three steering-wheels—one for the rudder and two for the movable horizontal planes—and finally the instruments. The envelope is made of two layers of cotton cloth with rubber between.

M. Clement-Bayard has just completed an "air yacht" for pleasure trips, very much like the "Ville de Paris," and proposes to go from Paris to Berlin and from Paris to London, during this summer. It is large, comfortable and finely furnished. The "Republique" was launched in July, 1908, a beautiful ship

THE "ZEPPELIN" AT LAKE CONSTANCE, 1908

accepted it while their new ship, "La Republique," was building. The "Ville de Paris," one of the largest yet built, made its best trip in January, 1908, when it completed a run of 147 miles in 7 hours 6 minutes. It is 200 feet long and 34 feet in diameter, and contains about 112,000 cubic feet of hydrogen gas. It is equipped with a 75 horse-power Argus motor, that drives a large propeller in front. A view along the deck of this new type of ship would show a square

that has made a speed of 35 miles an hour, and can carry from six to nine persons.

So much for France. Foremost of the German ships is the "Zeppelin," the largest and most important of all aerial craft yet built, and the exact opposite of the Wright brothers' aeroplane, which it directly challenges for supremacy of the skies. This great ship is 450 feet long and 42 feet in diameter, with a rigid framework of aluminum, enclosing six-

A BALLOON GREETING FROM JAMES GORDON BENNETT

teen balloons separated from each other. It has accommodations for nearly twenty persons, and is driven by two 110 horsepower Daimler Mercedes motors placed in two cars at either end. These cars are so arranged that they will float on the water in landing. The present ship is the result of the lessons learned from the four ships already built by Count Zeppelin, who spent all his large personal fortune in their construction. In 1907 he circled for ten hours over Lake Constance, and covered more than 200 miles at a speed of 20 miles an hour. In June, 1908, the "Zeppelin IV" was completed, being built to comply with the requirements of the German Government, which included remaining in the air for twenty-four hours and making a descent upon land or water. The price

was to be \$500,000. Count Zeppelin carried sixteen passengers on this trip, and crossed the Alps to Lucerne, cruising among the mountain peaks and stemming the eddies and varied winds. After passing thru a hailstorm he finally returned to Friedrichshafen, where he safely housed his craft in the balloon shed. On this trip the ship covered 235 miles, and averaged a speed of 22 miles an hour. The estimated radius of action is said to be about 800 miles, a distance sufficient to reach any of the great Continental capitals from the "Zeppelin's" harbor on Lake Constance.

Early in the morning of August 4th, last summer, the great ship set out to attempt the twenty-four-hour flight. There were some minor mishaps, but the "Zeppelin" went to Mayence, where it turned for the homeward journey. Early next morning the ship was destroyed by fire during an electric storm, after it had landed to repair an engine. This tragic disaster, following almost immediately upon the wonderful achievement of the Count, so aroused the German nation that a million and a half dol-

lars was at once contributed, and Count Zeppelin has arranged to rebuild his ship and to build eight others, while an Aerial Navy League has been formed.

At Frankfort there will be this summer a large aeronautical exposition; Zeppelin will be there to carry passengers, and so will Parseval. Almost every department of aeronautical activity will be represented. They are using the largest hall in Germany for this affair, which will last all summer. This may show how deep, how vital and how widespread the interest in aeronautics in Germany has become.

Aeroplane progress constitutes a department in itself, too extensive for inclusion here, but it is writing its record in the newspapers day by day—a record not of plans and promises, but of actual

achievement, a record in which America stands pre-eminent.

The following tables show what has been done along the various lines of aeronautical activity:

Balloon Records.

Distance, 1,193 miles—Count Henri de la Vaulx and Count Castillion de St. Victor, from Paris to Kovostycheff, Russia, October, 1900.

Hight, 34,000 feet (over six miles)—Dr. Berson and Herr Suering, July, 1901.

Speed, 68 miles per hour—M. Faure, London to Paris, 1905; 125 miles per hour—Segs-feld and Linke, Berlin to Antwerp, 1908.

Duration, 73 hours—Col. Von Schaak, Berlin to Norway, Gordon Bennett, 1908.

Dirigible Records.

Speed, 30 miles per hour—La Republique, France; 26 miles per hour—Zeppelin IV, Germany; 12 miles per hour—Dirigible II, England; 19.61 miles per hour—Dirigible I, United States.

Hight—French military claim rise to 6,000 feet; Patrie has been to 1,500 and Zeppelin to 2,600.

Duration—7 hours—Ville de Paris, January,

1908; 12 hours—Zeppelin IV, July, 1908; 19 hours—Zeppelin IV, August, 1908; 13 hours—Gross, September, 1908.

Distance—100 miles—Paris to Verdun, La Patrie, October, 1907; 200 miles—Circuit of Lake Constance, Zeppelin, October, 1907; 270 miles—Friedrichshafen to Lucerne and return (in 12 hours), Zeppelin IV, 1908; 360 miles—Friedrichshafen to Mayence and back to Echterningen, Zeppelin IV, August, 1908; 190 miles—Tegel to Magdeburg and return. Major Gross, German Military Airship, September, 1908.

Acroplane Records.

Distance—24½ miles—Dayton, Ohio, Wright Bros., October, 1905; 56 miles—Antvers, France, Wilbur Wright, September, 1908.

Speed—38 miles per hour—Wright Bros.; 40 miles per hour—Bleriot.

Hight—100 feet—Esnault-Pelterie, June, 1908; 150 feet—Wilbur Wright, September, 1908.

(Possible hight, 3-5,000 feet).

Duration—38 minutes—Wright Bros., October, 1905; 2 hours, 10 minutes—Wilbur Wright, 1908.

NEW YORK CITY

Latter Day Colony Life

BY POULTNEY BIGELOW

WHEN first I tied myself to a stake in my ancestral acres—referring to Malden-on-Hudson—which is not on the map; no more is the Garden of Eden—when, as I said before I joined the army of workers in the soil, then commenced for me a new world of economic realities versus second-hand opinions in the world of books and tall buildings.

The best way to study your fellow man is on the broad highway, where you talk as you trudge; next best to drive behind a pair of nags, for thus you may carry more baggage.

And with this preface let us hook up and drive from little Malden to mighty Onteora, 'way up in the tops of the Catskills, some 3,000 feet high. Here is a colony near a generation old—it carries me back to the time when the warm-hearted editor of *St. Nicholas*, Mary Mapes Dodge, retired into these woods for rest along with a few quiet spirits of sympathetic occupation.

Little by little the colony grew, and now, with Carroll Beckwith as its animating force, it is a model of its kind. Many of the pioneers of the Onteora Club are dead or gone elsewhere, as, for instance, James W. Alexander, the painter, and R. W. Gilder, but still it offers remarkable attractions to contemplative folk, and on the roll are such as Mrs. General Custer; Maude Adams; G. A. Reid, the architect; the authoress, Mrs. Runkle, and her daughter, Mrs. Bash (who wrote the "Helmet of Navarre"), and many others.

Onteora is a club built for the purpose of giving its members protection against some burdens incidental to residence in the country. No one may reside there who is not a member of the club, which means that all are more or less socially agreeable one to the other. The club provides water and disposes of sewage; maintains roads and paths, manages an excellent library, and employs watchmen at the gates to stop vagrant tourists who

R. W. WHITEHEAD

come from neighboring Tannersville in order to stare at the suppositious lions in this menagerie.

Onteora is a bit of social coöperation somewhat on the lines of Tuxedo, altho Tuxedo is an all the year round residence for men doing business in New York, whereas Onteora holds no one in winter save a few caretakers.

Tuxedo is vastly more elaborate, and has attracted a majority of wealthy or fashionable people, such as the Cuttings, Kanes, Hewitts, Claytons, Condons, whereas those who have gone to Onteora have, with one notable exception, done so in order to escape the slavery of conventional life. The road from Malden to Onteora leads up and up thru the magnificent Kaaterskill Clove, thru Palenville and Haines Falls—a road full of points where one stops in delight at magnificent scenic combinations—rock, forest, cascade—to the west the Hudson River and distant Berkshires

rolling away indefinitely in the mists of Massachusetts. Cascade is a bit poetical, for the water of this Kaaterskill is so much absorbed by the houses, hotels and cabins of Twilight Park that it reaches the foot of the Clove with about as much energy and sweetness as Jones Falls of Baltimore or Gowanus Creek in the Long Island desolation.

This Kaaterskill creek is now a bit of a mountain sewer, thanks to Twilight Park; yet, oddly enough, it has been selected by the Board of New York Water Commissioners as a prospective reservoir for New York City—according to the official map prepared by that honorable body.

But lest I be harsh toward Twilight Park let me hasten to say that it has many of the admirable features of Onteora—watchmen at the gates to protect the inhabitants from undesirable neighbors, also coöperative sewage and water supply.

The leading spirit of Twilight Park has been General Wingate, and his brother, the sanitary engineer, who was founder of the Twilight Club and its guiding spirit for many years.

Onteora is but four miles from Twi

light—also in the tops of the Catskill—each seeking to form a community fairly homogeneous. Twilight, however, is not a club in the true Onteora or Tuxedo sense; it is dominated rather by the mercantile spirit than that of art.

Copyright, 1908, by Jesse Furbox Birds.

GENERAL WINGATE, THE FOUNDER OF TWILIGHT PARK.

Today Twilight has three admirable inns, which scrutinize very closely the social claims of those applying for admission, and from a pleasant personal experience at each in turn it would be invidious in me to name one ahead of the other—indeed, I might place them on complete equality, prefacing simply that for one reason the Sunset might be chosen, for another the Ledge End, and for still different reasons the new Squirrel Inn.

Twilight, like Onteora, is a woodland

light—it disposes of all its sewage daily on the land and pollutes no streams.

Twilight drains down into the Kaaterskill Clove and helps to produce typhoid epidemics for Palenville and other communities in its course.

But once more hook up my nags and let's drive fifteen miles to the southern spur of the Catskills—and about the same mileage from Onteora—to the art colony near Woodstock—in the State of New York, let me emphasize.

Here are several dozens of bungalows.

CARROLL BECKWITH, THE ARTIST, AT HIS HOME AT ONTEORA PARK.

paradise; one can live apparently as in the heart of the Adirondacks, and yet be only a stone's throw from the highway, where comes the delivery wagons and the local postman. You may play at Robinson Crusoe in Twilight, as does Rouland, the painter, yet have running water on tap and a modern bathroom to boot.

Onteora has one advantage over Twi-

all colored like the partridge in order to escape observation.

Here rules the spirit of Ruskin and William Morris in the wiry and graceful person of Ralph Radcliffe Whitehead and his inimitable wife. They together have in the past half-dozen years created on the sterile slopes of this rock and forest wilderness an art colony suggesting Parnassus or the Groves of Academe,

where at very turn we see a white umbrella accompanied by a painting swain or maiden, and meet on the road inhabitants obviously of another and a higher world.

Byrdeliffe is the name of the little col-

heavy metals or carving of altar pieces out of blocks of wood—you may here find a Catskill Florence whose Lorenzo de Medici is Whitehead.

Thank God for the Whiteheads! is the natural ejaculation of him who has

Copyright, 1908, by Jesse Larbox Beals.

BIRGE HARRISON CRITICISING ONE OF HIS CLASS AMONG THE WOODSTOCK HILLS

ony proper, the residence of the Whiteheads, the central home, round which cluster dun-colored studios and workshops; and in the midst thereof a social hall or casino, where is an excellent library and reading room, a large gymnasium for calisthenics and for the Saturday evening entertainments, which form an important feature of the life here, for this is a colony of artists, and under that rubric I find singers and musicians and such as love to dance after the fashion of the gods of Greece.

In this colony you may come and study weaving and dyeing, the making of tapestries or jewelry, or working in

driven his horses from Malden, round thru Saugerties and Tootelum, then turned to the right at the Woodstock Tavern, and has enjoyed a mile or two of climbing up to the manor house.

Thank God for a man who will sacrifice his life in raising the standard of working and thinking.

Thank God for the Whiteheads. The local neighbors call them cranks. Thank God for that! For no one hereabouts is regarded as sane unless he work for money.

Robert Louis Stevenson was another Whitehead—curious resemblance between the two—each searching for health

FIRST HOUSE BUILT IN ONTARIO "TOLL'S LAND"

and finding it in helping others. The Whiteheads are benevolent despotism in its most heavenly form. They own a vast acreage, and on those acres dwell only such as are of the elect—and the elector is the lord of Byrdcliffe.

And this is as it should be. The captain of this craft is alone responsible for its cargo and its navigation. Can we quarrel with him if he selects his own officers and crew?

Byrdcliffe is successful. That is much to say of an idealist colony five miles from a railway station and 100 miles from New York. I know nothing of the Whitehead ledger or bank account, but to me a thing is successful when it breeds imitation, and today the whole neighborhood feels the impulse of the Whiteheads.

Our great landscape painter, Birge Harrison, has built him a home in the woods adjoining; and sixty of his art students followed him up to Woodstock this summer, all contributing to the tonic in this stimulating atmosphere of art work.

Mrs. Moore, the writer on Portugal, has last year built herself a camp in these woods; also several other ladies of lit-

crary and art working professions—some of them spending the whole year here, as do the Whiteheads and Birge Harrison.

Strictly speaking, the Whitehead-Byrdcliffe colony is not responsible for the many who have built for themselves homes outside of its bounds; but, speaking philosophically, each is a part of the other—each would be poorer for the loss of the other—and all unite in blessing Byrdcliffe, whatever criticism may escape in matter of detail. The dances, which are a weekly function, show the Lord and Lady of Byrdcliffe to be true socialists and gentle folk—no conventional evening dress is tolerated—men come in their picturesque flannels or working dress, the ladies come in their studio habiliments, and a more pleasing effect it would be hard to imagine.

All are made welcome—all who enter into the spirit of the game—the young men and maidens of the Art Students' League are here just as happy as those from the inner circle—the farmers and helpers on the place come, as do their daughters and wives; and I speak with feeling, for did I not find myself one evening partner in a country dance with

a kitchen maid who danced better than many a peeress.

The word colony is used for Byrdcliffe in a loose manner; it would be perhaps more exact to regard Byrdcliffe as Mr. Whitehead's family estate, with art schools incidental to the place.

Today so much land has been bought round Byrdcliffe and houses built thereon by independent owners, attracted by the artistic fellowship, that only about

ing to the student of economics, as instance of the modern tendency to gather into colonies for the sake of protection and efficient administration in the matter of drainage, water supply, etc.

Another colony is at my doors, some eighteen miles away, also up in the Catskills. This is known as Elka Park, which, however, I have not yet visited, but from reports of those who have, it is excellently laid out, has many charming

CLASS AT MR. WHITEHEAD'S ARTS AND CRAFTS COLONY

half of the larger community enjoys coöperative or socialistic administration on the Onteora or Tuxedo plan.

Tuxedo and Byrdcliffe are at the opposite poles of country coöperative colony life. At Byrdcliffe no one but an artist could live happily; at Tuxedo an artist would be as much out of place as a philanthropist in the New York Custom House.

Each draws its own congenial population; each is successful; each is interest-

residences, is managed after the Tuxedo-Onteora plan, and is successful. Germans control it, and Germans understand the value of municipal coöperation.

Last week I drove from Malden up the Hudson to Mechanicsville, and thence to Saratoga, in order to see once more a city famed not only for its race track and gambling tables, but also for having a model sewage disposal plant—thanks to Mr. Spencer Trask.

This same Spencer Trask is another of

those whom the world admires—fifty years after their death.

He has fought the gambling in Saratoga, and for that has been denounced by the most respectable merchants and church members of the town as an enemy of his community.

But today another proposition interests this indefatigable humanitarian, no less than planting on the shores of Lake George another art colony—a casino, reading room, bungalow, studios and boating. Mr. Trask has the land; he has the means, and, more than all, he has the personal qualities of the man who does what he undertakes. It is too early to say of the Trask colony more than that I have visited the ground in company with its projector and found it admirably chosen for health and recreation.

And so now we are at the end of our colony drives from Malden-on-Hudson—all done within the past few days, all behind the same pair of nags, and all therefore within road-driving radius of my little patch of homestead, including Tuxedo.

There are, no doubt, many other co-operative colonies; Llewellyn Park, near Orange, is one of the oldest that I know; there will, no doubt, be many more added to those already existing. In Europe they are rare, if not unknown, and therefore presumably a product of peculiarly American conditions of country life.

The city bred and civilized American who yearns for a home in the country, unless he be of considerable fortune, discovers very soon, to his surprise and annoyance, that while land itself is phenomenally cheap, anywhere beyond commuting distance he gets very little for his money.

Land is cheap, and for the good reason that land carries with it burdens

which are unknown to the same extent in any other country as in the big cities of our own. The man who moves his family to the real country finds himself in conditions where it is very difficult to procure service at any price. This to me is no hardship, for I do my own chores, and recommend this as a means of depleting our present plethora of nerve cure homes.

The city man pays in the country high taxes for State, county, school and roads, and in return gets nothing that is tangible or that is not the spontaneous gift of God, like sunshine, soil and fresh air. He gets no police protection, the highways are not safe for his children; in wet weather the roads are puddles and in dry they are dust wallows; pedestrian exercise becomes a lost art, for sidewalks are not known save sporadically.

He may plant an orchard; he may wish to preserve fish in his stream or birds in his woods. He will discover that in the absence of any effective game or highway policing he will be only planting that which others appropriate. He will find that his land is expected to pay heavier taxes than the land of his neighbors, because he presumably attempts to paint his house or otherwise render the place attractive. For each improvement the local politicians raise his taxes, but do not give him corresponding protection.

This protection which he fails to find in the orthodox country he seeks in On-teora, Tuxedo, Twilight, Byrdcliffe. We are compelled to the conclusion that one reason why country life in England still hold its charm for Americans, no less than Britons, is because rural England enjoys the benefits of honest and efficient administration. But of this, more some other day.

The Aristocrats of the Yachting World

BY GEORGE ETHELBERT WALSH

Photographs by courtesy of Stanley M. Seaman

THOSE of us who look back with pride to the history and prestige of American shipping, when our flag fluttered from the mast-head of home-built boats in nearly every civilized harbor of the world, and then turn with regret to the present, when our shipbuilding trade for international commerce has declined almost to the vanishing point, should take heart and courage from the activities and successes in another field of marine architecture which is making American boats famous on the high seas. The genius and skill which went into the designing of the early tea clippers, and the smart

"ketches" and big square riggers that swept the seven seas from the Orient to the Occident, and made the American flag a byword in every port of the world, have not died out thru our policy of indifference to our shipping needs, but have been directed into another channel. Instead of building ships and steamers for carrying the world's trade, we have been busy in designing pleasure boats, great ocean-going steam yachts, swift motorboats, and racing sloops and schooners.

The Yankee genius that early established our power and prestige on the seas may be studied best today in the

HOWARD GOULD'S "NIAGARA"

yachting world. None of the cunning of the hand of the designer has been lost here. There has always been an element of the sportsman in our shipbuilders. It

degree of perfection. In nearly all of the international races with sloops, schooners, steam yachts, and more recently with motorboats, the victory has

WILSON MARSHALL'S "ATLANTIC"

was the speed of our great tea clippers as much as their stamelnness which made them famous, and the models of the New England "ketches" were designed for quick work in the water. Our privateers could fight or run away and fight another day, because their builders had made them the fastest boats of their class. The fame of a shipbuilder depended upon the speed of his craft.

So it may be said that our modern yacht designers have inherited this gift for turning out fast and graceful yachts from their sturdy Yankee ancestors, who built with the double purpose of capturing trade and incidentally of beating anything on the high seas. Certainly we have carried yacht building to a high

been won by American creations. The genius of a Herreshoff has preserved to us indefinitely the America's cup. The big auxiliary steam yacht "Atlantic" won for us the Empress's Cup, offered by the German Emperor, and now "Dixie II," the fastest motorboat, after winning easily from her English competitors last year, goes abroad this season to enter the lists against French, German, English and other swift motorboats.

Besides the fastest yachts in the world, we have some of the largest and most luxurious craft of any nation. We boast of the largest yachting fleet in the world—almost two to one to any other nation. This fleet is scattered over the longest coast of any maritime nation. Not only

from the Gulf to Maine, and from Washington to Southern California, do we find sections of this great fleet, but for thousands of miles along the Great Lakes and inland watercourses. These yachts in the aggregate make an enormous tonnage, and in numbers they represent the national interest in water sports of every character and description.

At the head of this great national fleet of pleasure boats are the big steam yachts owned by private individuals, and representing our country's interest in a way not always appreciated. These luxurious yachts carry the American flag to all parts of the world and advertise, as it were, the skill and workmanship of the descendants of the old Yankee masters. In times of war, as illustrated in the Spanish-American outbreak, the speedy yachts can easily be converted into dis-

ment that make them of great service to the country in times of war.

There is something more than a mere personal gratification in owning a magnificent steam yacht of the latest design and equipment. The whole country takes a certain pride in turning out from American shipyards a craft of this type. The national pride in our fleet is broad enough to include the private yacht of some millionaire who as a rule enters the boat under some American yacht club and enters races to compete with the products of other builders. Without the millionaire among us it would be impossible to have these magnificent yachts constructed to grace our seas and enhance the national genius for yacht designing and building.

Our fleet of great private steam yachts has grown in recent years until it num-

MR. MARSHALL'S STATEROOM ON THE ATLANTIC

ber over a score of the first class and more than double that number of the second class. In the third class the num-

ber over a score of the first class and more than double that number of the second class. In the third class the num-

bers are so great that it would be difficult to enumerate them. In this class are included steam yachts ranging from 50 to 100 feet and in the second class those from 100 to 200 feet in length. Beyond these are the big yachts exceeding 200 feet in length, as large as many ocean steamers and more costly. How-

Steam yachts of this class are designed for comfort, grace and speed, and that they attain all three is evident from a study of their pictures or of their records. The luxurious equipments entitle them to the name of a private floating mansion. They provide all that a home could offer, with electric lights, artificial

THE CELT
Owned by J. Rogers Maxwell, 282 feet in length and 36 feet beam

ard Gould's "Niagara" is a fair representative of this class, having dimensions of 282 feet in length and 36 feet beam. A steam yacht of this class may cost from \$100,000 to several hundred thousand dollars, depending much upon the interior equipments and finish. J. Pierpont Morgan's "Corsair" and Commodore Gerry's magnificent yacht belong to this class and also Wilson Marshall's famous "Atlantic," which won the Emperor's cup in 1905 for the transatlantic race, and the "Celt," owned by J. Rogers Maxwell.

refrigeration, steam heat, electric fans, tiled bath, magnificently furnished dining rooms, saloons and staterooms. The interiors are finished off with the most expensive woods—mahogany, satinwood, rosewood and teakwood. Marine architects have devoted nearly as much time and study to the interior finish of the saloons and staterooms of these handsome yachts as the land architect has to the designing of our Fifth avenue mansions. The panels and overhead beams are often veneered with half a dozen kinds of rare woods, and the floors are

inlaid with parquetry that surpasses the work of most of our homes ashore.

The initial cost of a great private yacht, be it one, two, four or five hundred thousand dollars, is, after all, only a small part of the investment. The maintenance of such a craft when in commission is very great. Fifty thousand dollars a season is frequently given as the amount spent for running such a craft, but this includes a large part of the expense of entertaining. The "Niagara's" bare expense of running, including salaries of the officers and crews, cost of coal consumed, and the ordinary minor expenses of maintenance, ranges from \$15,000 to \$25,000, with an average of \$20,000. But as such a yacht nearly always carries visitors and friends, the

ing to the length of the cruises, brings up a big total of standing expenses. Then there is the cost of repairs and dockage, and rent for winter quarters.

The motorboat has in the last few years made tremendous strides. At first the gasoline engine was not considered suitable for big boats. But this idea has been exploded in recent years, and gasoline engines have been installed in our commercial craft up to 500 feet in length. Naturally this has affected the yachting interests. A great many predict the doom of the steam yacht under 100 feet. In yachts of this class the gasoline engine can take the place of steam, and show economy in building and operating. Dozens of our yachts under 75 feet are today equipt with gasoline instead of steam

A TYPICAL MOTORBOAT AT FULL SPEED

cost of living aboard and entertaining may easily eat up nearly as much more.

A yacht of this character must carry a crew of three or four officers and fifteen or twenty men. The salaries of these men make a handsome total, and the coal consumed, varying from one hundred to several thousand tons a season, accord-

ing to the length of the cruises, brings up a big total of standing expenses. Then there is the cost of repairs and dockage, and rent for winter quarters.

The motorboat has in the last few years made tremendous strides. At first the gasoline engine was not considered suitable for big boats. But this idea has been exploded in recent years, and gasoline engines have been installed in our commercial craft up to 500 feet in length. Naturally this has affected the yachting interests. A great many predict the doom of the steam yacht under 100 feet. In yachts of this class the gasoline engine can take the place of steam, and show economy in building and operating. Dozens of our yachts under 75 feet are today equipt with gasoline instead of steam

world have carried their offices with them on their big yachts. Such men have perfectly appointed offices aboard where they can transact important negotiations almost as well as on land. These yachts are equipt with wireless systems, so that, while cruising along the shore they are rarely outside of touch with Wall Street or their offices in the city. The quotations of the Stock Exchange and communications with their offices pass continually between the shore and the yachts if business demands it. The big yacht thus enables the millionaire to get his daily

funnels and their clean white prows, add dignity and grace to the large gathering of fleet sailing craft. Sometimes a dozen of these big steam yachts accompany the fleet on its summer cruise, and their combined value represents a million or two of dollars. They are the aristocracy of the fleet—solid, substantial, dignified and high-bred. They are not mere racing machines. Their designers have sacrificed nothing for speed, but instead they have tried to perpetuate in their lines the grace and beauty of a typical American marine architecture. They stand for what is the highest and best in modern

How to Select an Automobile

BY CHARLES E. DURYEA

IN times now largely past, the automobile was a luxury, a thing only for sport and ostentation, and was bought to gratify a whim or ambition of the buyer rather than for sober, practical use. The color of the paint, the bewildering variety of brass fittings on the dash, the number of cylinders, the large price or some other extreme but unimportant feature, influenced the decision; with the result that many buyers found they did not have what they wanted after the novelty wore off, and later the market was flooded with second-hand automobiles for which there were no buyers, because they did not meet the needs of the public.

With facts like this before him every buyer should and may avoid a like ex-

perience by giving a little consideration to his needs and selecting a vehicle suited to his requirements. Then and only then will he find the auto a thing of joy, a time saver, an economic method of getting from place to place, as his needs or the needs of his family require, and a convenience that he will appreciate so much he will wonder how he ever got along without it.

A few short years ago autos were much alike, and to buy a different one was to be out of style. Being stylish, they were assumed to be beautiful, altho Ruskin very truly points out that the two chief factors of beauty are fitness to purpose and truth. Today the public has learned to be less narrow, and wise buyers know much better their needs

THE WHITE MACHINE ON THE ROAD

THE LIMOUSINE TYPE.

and uses for such vehicles. They are now selecting structures more with reference to their use and less with some individual whim or caprice as their guide.

The first thing to decide, then, is the use to which the vehicle will be put. Not occasionally, as when one wishes to take the neighbors for a ride, but regularly in the service of the owner or of his family. The novelty of owning an automobile has largely worn off. The neighbors have one of their own. The whole family has become so accustomed to auto riding that some members generally prefer to ride alone or remain behind while others go. In short, the conditions of past years are not with us so strongly today.

Further, the makers of these vehicles recognize that the day of one style only has past, and are offering many designs from which to choose. From the big limousine, thru the taxicab and town car, to the touring car, large and small, and on down from the gentleman's high-

powered runabout, and the small, moderate-priced runabout, to the motor buggy and even to the little Browniekar for the children, is found a large line suited to almost every need. In electric vehicles a wide variety is shown, while the steamers have staunch advocates. In this profusion the buyer has much to consider, that he may get the one best suited to his needs and therefore most certain to give him satisfaction. He must also consider who is to care for this rig.

If a hired expert has this duty, the owner may enjoy brass finish, a dashful of gewgaws, numerous cylinders with all sorts of fittings galore; and may offer the plea with much truth that the man needs the work. But if the car is to be kept at a public garage, these many splendors frequently become eyesores because of the difficulty of getting them kept in the spick and span order required by good taste. Better simpler mechanism and less ornate design and have these few parts better kept. If the owner or his family are to care for the

vehicle then surely neat simplicity must rule. The pleasant ride must not be marred by the thought of the cleaning required before the next ride can be taken. The valuable time that should be given to healthful and invigorating riding must not be spent in needless polishing of metal and washing of mud. The vehicle should be the servant, not the master.

And in this land of bad roads, where it is to be used is also important. The small-wheeled, low-clearance affair so common in the past has its troubles in bad road sections and should be avoided. Popular experience is shown by the increase of eight inches in the diameter of commonly used wheel sizes in the past eight years. Heavy weight is not so objectionable where the roads are hard and level and it adds a steadiness to the riding. But it increases very much the tire expense, detracts from the flexibility of the vehicle, and is particularly bad where the roads are soft. Every pound added to a vehicle requires a pound of engine and mechanism to propel it, while the capability is reduced rather than in-

creased, as is well shown by the splendid performances of the smaller and lighter autos. With these general thoughts in mind, the specific form of vehicle must be determined by its use. For both city and country work, with little regard to expense and in all weathers and seasons, the large limousine is the car. Powerful and fast for touring, it is also suited to city work, conveying the family and friends to the desired destination afternoon or evening, in good weather or bad. Well built and carefully enclosed, it is clean, comfortable, safe and speedy. But if long-distance touring is the principal usage, give preference to the touring car proper. Built specially for this class of work, with weight well down, with wheels large and base quite long, it rides safely and comfortably, altho roads may be rough and speeds may be high. Its folding top is ever ready to protect from showers, but is quickly laid to the rear when sunshine and scenery are to be enjoyed. Its powerful motor has power to spare when bad roads or steep hills loom in sight and its riders take delight in feeling superior to petty annoy-

THE LITTLE MAXWELL CAR

ances like sand and mud that make travel a burden to horse vehicles or even to motors of less power.

For city use only the smaller town car, with its shorter wheel base and more compact body, is handier and better. Usually of lighter weight and less power, it serves its purpose in a superior manner. Still smaller than this is the cab, which, like the others, may be fully enclosed for protection from the weather, but which for smaller parties is amply large and most satisfactory.

More plentiful in number and particularly suited to the average family is the medium touring car. With power enough to be practical anywhere, it is not so expensive to maintain and operate. It brings the beauties of the country within reach of the city dwellers, and yet, when stripped of its tonneau, its owner has a speedy runabout that will take him to business or about his business in the shortest possible time. Its mechanism is less likely to be complicated unnecessarily, its weight is more nearly proportioned to the live load it

will carry than its larger brethren, and its running expense comes much closer to the cost of other means of conveyance.

For the daily use of the busy doctor, solicitor, collector, inspector, contractor or other business man, as well as for the many little pleasure trips where two are company, but three a crowd, the little runabouts shine brightly. Light in weight, short in base, handy to operate, simple to clean and repair, and cheap to maintain, they are used in great numbers and with splendid satisfaction, and may be bought without fear by one needing this type. Into their field of late years has come a new design, not to lessen their number, but to supply the many to whom the small wheels and air tires do not appeal.

The motor buggy smooths the road by its large wheels rather than by large tires. It rolls over the rough spots rather than softens the drop into them. Its solid rubber tires cut thru the mud, sand and snow easily where the large air tire must roll over or be forced thru

DURYEA'S BUGGY NO. 1

with great expenditure of power. Its high wheels roll into the deep mud while carrying the passengers well above. It does not raise the dust so high and rides over the dust the other vehicles raise. Lighter in weight and simpler in construction, it fills a place not filled by other designs, and contributes to the rapidly growing multitude of auto users. Particularly ready at all times, it runs the little errands for the family, as well as serves the busy doctor who cannot bother with tire troubles. It serves as a touring car tender and as a buggy substitute. Its field is rapidly extending as its merits become known.

All of these vehicles have mechanism, and here the novice becomes bewildered. One dealer dilates on the merits of six cylinders while another tells him there are troubles enough with one. On one side he hears of sliding gears, on another of planetary or frictions. Water cooling has its host of users, while air cooling seems to be gaining ground. And thus it goes. In time past the buyer settled this mental muddle by choosing the most complicated, on the theory that if one is good, two are better. But this is clearly erroneous. If price and maintenance cost are not considered, and if the skilled man is present properly to care for the complicated structure, choose the larger number of cylinders, the wider range of speed changes, and in general the most highly developed devices. But for the golden mean stick to the two and four cylinder motors, the two or at most three speeds forward, and the simplest arrangements of ignition, cooling, braking, oiling and similar necessary things. Up to 20 h. p., 1,500 pounds weight, and 25 miles per hour, two cylinders and two speeds forward are enough. For double these, use the four-cylinder motor and three speeds forward. Beyond this, use the six cylinder motor and four speeds forward. If extreme simplicity is wanted use the single cylinder, the planetary

or friction gear, and the air cooling. These are all well proven and no longer looked upon as *passé*. They have their place and in it serve better than more complicated devices. Air cooling requires a little better design than does water cooling, which makes up in amount of cooling surface what it lacks in quality, but proven designs are safe to buy. Other things being equal, buy a car recommended by a nearby agent, for in case of trouble he will assist, whereas, if not interested in the vehicle and not acquainted with it, his assistance may be worse than useless.

In general, remember that in autos utility is the basis of beauty; that simplicity is a cardinal virtue, and that light weight with moderate power is better than large weight with large power. Seek the ability to climb hills slowly on the high gear rather than to race up them, for this proves the stamina of the engine. Test the controlling devices to be sure they are easily reached and easily handled. Select large wheels and large tires, for the maker who saves money on these important parts has probably saved on other important ones, to the further detriment of the vehicle. Nickel finish does not require the care that brass does. "Beauty unadorned is adorned the most" is a good saw to remember when selecting finish. Accessibility should be kept in mind. Somebody may have to put a wrench on those nuts. See if it can be easily done. In short, learn your mechanism. You will have to do this after buying most likely, and doing it pretty fully before will make your decision all the surer. The man who knows his vehicle succeeds with it much better than the one who does not; and success is what you want.

Finally, having bought with judgment, drive with judgment. Autos stand years of use, but abuse quickly brings trouble, just as certainly as care and skill bring pleasure and splendid service.

RECORD PA.

Vacation Experiences

[Reading of unattainable vacations, such as hunting lions in Africa, exploring the Antarctic regions, climbing the Andes, yachting in the Mediterranean, or ballooning across the continent, is often enjoyable, but it does not help to solve the question in which the reader is most interested, how to make the most of his money and, still more precious, time, he can spend on his vacation. But any of the outings described in the following time, he can spend on his own vacation. But any of the outings described in the following letters from our readers are attainable by our readers and they all are reported to have been enjoyable, even tho the writers do not always make plain in what the enjoyment consisted. These "experience meetings" of ours seem to give us practical results in pastimes as they do in politics. To all who have been kind enough to send in accounts of their success in seeking rest and pleasure, and especially to those who do not find their letters in these pages we here express our hearty thanks and our hope that their next vacation will be even more enjoyable than the one they wrote to us about.—EDITOR.]

In a Hospital.

Many others have taken this journey, but not all have thought of it as a vacation.

The need was imperative. An uncle doctor came hurriedly across three States to see me safely thru. The dear home folks made every preparation easy. The journey was short. Only a little ride thru lanes

redolent with June to our little city hospital, lying just south of "God's Acre." The time spent on the long white table in the sunny, tiled room leaves only a memory of the white-clad nurses and doctors and the tense drawn face of the best beloved. Then the dreamless sleep and the slow awakening in another room on a little narrow bed, which was the scene of this vacation; still the white-capped nurses, the doctors, now in ordinary dress, and the dear face, not so white and drawn. Thus began the real pleasure of this resting time. The peacefulness of the early summer stole into the windows, all the sweetness of the young growing things, the songs of the birds mingled harmoniously with noiseless attention of doctors and nurses. Always the perfume of June will bring to me the memory of that hospital room, a bower of beauty around me. Never flowers so sweet as they. Each one meant a friend's love and sympathy. Then there were whole hours to study the beauty of a single flower. Each day they changed, and always with some personal word of cheer. Surely the bond of a hospital cot draws the ties of friendship closer.

Then the day the doctor came to tell me the danger was over. I was to go out the south door, to life again, and not the north, to rest

forever. Then he added like a boy, "I feel just like going out behind the barn and throwing up my hat and shouting." This, from the man I had thought only delighted in cutting up people.

Who could fail to get an inspiration from those noble, self-sacrificing girls who daily administered to my need? Then, sometimes, I caught glimpses of their lives. The time the night nurse lingered in the moonlight of the June-scented room and told me a life story as she looked out over the sleeping city. The pride with which the little apprentice slipped in to show me her cap and uniform the day she was accepted, and came to kiss me good-bye when I was dismissed. These linger with me, deep and lasting pleasures. Then the glad day when the children came to see mama. How awed they were, not daring to come to me at first, until the youngest crept up beside me to tell me how good they were and how many ducks had hatched, and how old Rosecomb picked a baby chick to death. Yes. My vacation was helping them. When I could read they brought me the Vacation Number of THE INDEPENDENT. Nurse and I enjoyed it together. Then I sent it to the childish voice I had heard down the hall; then to my noisy neighbor on the east; then to the floor above, where I had heard a baby cry, and caught the sound of a faint lullaby. Surely no one ever cheered more people who were not enjoying their vacations. When my vacation was over and I slipped out into sunshine and health and home, it was with the consciousness of time well spent, friendships strengthened, home ties much dearer, glimpses of noble men and women to broaden my views of life, and

health restored. Who needs more than that for a vacation?

A FARMER'S WIFE.

Down the O-hi-o.

There were two of us—callow college freshmen—with a restless desire to see the world. We had read "Huckleberry Finn," and the idea came to us that a trip down the Ohio and Mississippi rivers would furnish the requisite excitement.

Early one June morning we started on wheels from the northern part of Ohio for Cincinnati. Four days later we reached the city and found awaiting us the box of camp supplies which we had shipped from "up State." We sold our bicycles and with the proceeds purchased a second-hand skiff, which we filled with provisions, fishing tackle, and other articles necessary for our expedition. About 6 p. m., with our boat piled high with boxes, paper bags, cooking utensils, etc., we pushed out upon the dirty, yellow river, which, I must confess, did not look quite as attractive as we had anticipated.

Our first night upon the river was far from pleasant. It was cold, wet and foggy, and after rowing an hour, we could not see a yard in front of us. Then it began to rain in torrents, and we sat there hour after hour, drenched thru and thru, with the boat drifting with the current. It was fortunate that we were not run down by one of the river steamers. But Providence looks after fools. Early in the morning we rowed to shore, drew up the boat upon a muddy bank, and proceeded to pitch our small tent near a clump of cottonwood trees. The day broke fair, and soon our clothes were drying in the sun, and we looked over our provisions to see what could be saved from the devastation of the night. We then built a fire, made coffee and ate our breakfast, and began to look more cheerful.

As a general rule, we traveled both day and night, sleeping in the boat—a rather hard place to sleep, by the way. On one occasion our slumbers were rudely disturbed by a thoudousing caused by the waves dashing over the side of the boat after one of the big steamers passed us. Sometimes, if we found an attractive spot, we would stop and camp for a few days. When we were out of money we gave the farmers a helping hand. On one occasion we replenished our exchequer by catching a catfish which weighed about fifty pounds. There being no market at hand, we rowed all night to reach a small town on the Kentucky side, where we sold our fish for about \$4. Our days were spent fishing, swimming, visiting interesting spots along the way, and chatting with the queer specimens of humanity that one meets along these great waterways. About the last of August we reached Cairo, Ill., at the junction of the Mississippi and Ohio, which proved to be the terminus of our trip for urgent parental appeals called us to more important duties.

A. W. GOODENOUGH.

A Haying Vacation.

Leaving a young minister in charge of my church, I put on workingman's clothes, and, after riding thirty-five miles on the cars, set out on foot to hunt up a "job in haying." I had some difficulty in finding a place; but, finally, with the aid of a hotel landlord and a telephone clerk, I was hired out to a farmer. The people who employed me were somewhat curious to know who I might be, but I managed to evade their questions and would not have been found out had not a telephone call come for me to return home to attend the funeral services of one of my flock. The farmer and his wife were very much concerned when they learned that their new hired man was a preacher. The farmer had guarded his pocketbook well on retiring the night before, and that doubtless added to their chagrin. I assured them that I was much pleased with the way they had treated me, and begged that they allow me to return and work as if they did not know who I was. Finally they consented, and I worked for them three weeks and earned twenty-six dollars and twenty-five cents, besides my board. The farmer's wife tried to have me sleep in the parlor bedroom when I returned from the funeral, but I preferred my upstairs chamber.

And I had a fine vacation. Up at four-thirty, milk, eat breakfast, grind scythes and "sections," mow by hand or with machine, rake, "bunch up," "draw in," "mow away"—that was the daily program. My nerves were rested, my muscles became hardened, my skin was browned and I was a new man. I came back to my work with vigor and enthusiasm, satisfied that for value and cheapness my outing could not be surpassed. And I have a good place to visit, too, when I want to get away for a day or so.

(REV.) LINCOLN R. LONG.

MARIONETTES, N. Y.

The Marine Gardens at Catalina.

We were camping at Avalon, on Catalina Island, California, and among the pleasant things we found to do none was more delightful than our trip to the Marine Gardens. It was a perfect August morning, and we made our way happily among the campers and bathers to the little pier, where we found the small glass-bottomed boat our host had chartered for our trip to the far-famed Marine Gardens of Santa Catalina. The boat was like a large scow with seats around the edge, a bottom made of glass, and a canopy over the top to protect us from the sun. As we pushed off we looked back at the bare, rugged mountains outlined sharply against the clear blue of the sky. At their feet nestled the little town of Avalon, almost hidden by the sheltering green of its many trees. We rowed out into the bay, leaving behind the fleet of small boats that only awaited a beckoning

hand to give one a pleasant day on the water.

But now our oarsman calls our attention to the water beneath us, and we look down thru the clear glass to the pebbly bottom of the bay. The effect is magical. It makes us forget the mountains and the valleys and the life which inhabits them, for we are now seeing thru the medium of clear water into which the sun sends its mysterious rays of light. We begin to realize that we are in a new world, and wonder what it will have to unfold to our curious gaze. Suddenly we see a school of sardines sweep past like a flutter of silver ribbons; then, the cause of this commotion, a hungry yellowtail. Now we pass a beautiful rock bass, and it recalls the excitement of yesterday, when I pulled in my line to find one nearly as large at the end.

Presently the bottom changes to great rocks, high mountains and deep canyons, like those of the Island. And on these submarine slopes are the beautiful gardens. It is impossible to tell all the wonders of that garden, where the majestic tree-kelp sways its glistening brown leaves a hundred feet above its moorings in the rocky bottom. The farther we advance the more beautiful it becomes. There is the graceful ribbon-kelp, covered with pure white polka dots, and a brilliant deep green fern, that harmonizes perfectly with a great bed of pink coral or a garden of sea violets; and here, too, are the mermaid's boas, hundreds of them, a deep wine color. All these beautiful plants are swayed gently back and forth by the ebb and flow of the tide, and, as they reveal and conceal the rocks beneath, we catch glimpses of sea anemones, or, in a cleft of the rocks, see the spines of the sea urchin; and here, too, are sea cucumbers,

THE FRIGHTENED PIGS.

THE SKULL OF THE PREHISTORIC ANIMAL.
Photograph by L. C. Lincoln, Canandaigua, N. Y.

while floating near the bottom are yellow tomatoes. A ray of sunlight strikes an abandoned abalone shell, which adds its note of color to the rest.

But this is not all, for swimming leisurely in and out are the real visitors to this park, the fishes—beautiful great gold fish, and electric fish, each with its spots of blue flame, and here and there slender lavender or pale blue fish. We try to realize the tranquil happiness of these guests of a sea paradise.

And so we pass on, till suddenly we see only the pebbly bottom again, and we know our dream is over, and we must leave this mysterious, tranquil world.

Los Angeles, Cal.

A Farmer's Observation of City People.

The writer is a farmer with whom some people

spend their vacations. Some come early to see the opening of the season, to enjoy Nature when she is fully robed and putting forth her greatest of leaf and bloom. Some come in midsummer to escape the heat of the city and

to enjoy the cool breezes which blow from the lake, and the shade of the forest trees. Others visit us in the autumn, that they may pluck the golden fruit and see the frost-colored leaves just before winter.

At the dinner table they will comment upon the luxury of the farmer's life; how he does most of his work riding upon some machine, or spends much of his time visiting and going to town; that his work is easy and under pleasant surroundings, with healthful conditions; that his life must be a continual round of delight and pleasure.

A business man and his lady friend, both of whom were college graduates, took a walk thru one of the secluded ra-

vines. Upon their return they brought what they supposed to be a bone of some prehistoric age, a subject for the museum, which they had found protruding from a bank of earth. It was surely the head of some animal of ancient time, for they went to the barn and compared it with all the domestic animals to be found there. The peculiar antlers, the large holes for the eyes, made it certain that this was no ordinary specimen. Here is a photograph of it. Perhaps some paleontologist can identify it.

The minister who spends his vacation in the fall wanted to show how he could pick apples. He went to work by the side of a man who had picked 125 bushels the day before. He soon found that his soft muscles and over two hundred pounds' weight took him out of the class of the man with whom he was working. At noon time, when the apples were loaded upon the wagon, he placed himself upon a crate upon the rear end for a ride to the house. The horses started up quickly where the limbs were low and the minister was thrown to the ground upon his head and shoulders, with no serious consequences except slight bruises. People on their vacations are always welcome in the country, where they add much to the social and financial interest of the farmer.

L. C. LINCOLN.

CANANDAIGUA, N. Y.

A Vacation Receipt.

Recipe for the most exhilarating and restful trip I know: A good horse, a light carriage, a small suitcase, wrench, axle-grease, small rope and hammer (for possible accidents), lunch basket, with lunch, two glasses and a milk bottle, hammock, pillow, lap-robe, book, pail of oats and a halter; lastly, the accurate map ('05) of the United States Geological Survey, showing altitudes, roads, etc.

We start at 8, drive till noon, stopping at a farm for milk on the way. In shady woods we hang hammock and spread lap-robe, unharness horse and later feed him, then water him at first opportunity, often close at hand, from brook or well. We read, nap and eat, sometimes finding berries to be had for the picking. About 3 we resume our journey of exploration, sometimes with the added zest of looking up old and historic places. Many a pleasant hour or half-day have we spent amid Revolutionary memories, many a pleasant acquaintance made, all ready and proud to impart information.

We find a nice farm house for supper and over-night accommodation, always preferring that to any hotel, and how many delicious country meals we have had, pleasant rooms and a sociable evening with a companionable family, pleased with guests who make little trouble and are agreeable. We care for our horses and the barn supplies him with good bed and board. Next day, after

breakfast, we start early, exploring again at our leisure. Of a traveling baker or an attractive store we buy rolls and cake, keeping butter, cheese and fruit on hand besides.

We have scarcely ever had rain, but have our storm curtains and rain coats.

It is a care-free existence, an ever changing scene of farms and towns, fine scenery and interesting building. Fresh air all day and about the same expense as at home, because feed for the horse is less, no fuel or other expenses of home, thus making up for our own board and lodging. MRS. GEO. DONALDSON.

CLIFFSIDE, N. J.

In Colorado's Mountains.

Two years ago the Stantons, of Kansas City, invited a cosmopolitan party to spend a few weeks with them at their favorite Colorado resort. The guests were four in number—a lawyer from Boston, a preacher from Chicago, a kindergartner from Omaha, and myself, from Toledo.

What a beautiful place our friends had chosen for us! There was Mount Esther and the Rainbow Falls at the south, Mount McKinley at the north, an unnamed range of rugged peaks at the west, another at the east, and, towering over Mount Esther, on any clear day we could see Pike's Peak with its majestic snow-crowned summit.

Our cottage, the one we loved best, was a tiny two-room affair, where we ate and ate, and laughed and laughed. Near by we had a six-room bungalow that we called the "Annex." It was there that we slept.

Our kindergartner was an ardent disciple of the physical culture, uncooked food, deep breathing, water drinking and mountain climbing theories. She hadn't figured on a mountain-climbing appetite when first she set forth her theories in glowing colors, for at the end of two weeks of mountain climbing the rest of us threatened to divide our provisions, both cooked and uncooked, to save ourselves from the threatened danger of having to break camp early because of Miss Kindergartner's appetite.

Our lawyer fished three days faithfully in the trout lake and caught one trout. What a pretty little speckled sun trout he was! Mr. Lawyer's joy knew no bounds. After that, early morning, sunny noon and dewy evening (no, not dewy, for we had no dew) found him at the trout lake. He did become an expert angler, and Miss Kindergartner, too, became so interested in fishing that she abandoned her mountain climbing and "took to fishing" instead. She is Mrs. Lawyer now.

The rest of us climbed mountains, read and sang, with the music of the waterfall in our ears. We rode, too, to almost inaccessible places upon the backs of sleepy, slow, sure-footed burros. We drove in huge wagons to more accessible places. Our horses were of a nondescript kind that are popularly called mustangs. Usually the horses were "locoed" and had "fits" at all sorts of inopportune times; they broke the wagons and their harness when we were miles from home, but that did not

matter. We could patch up things, and we were having fun anyway.

But the first of September came long before we were ready for it. The forget-me-nots froze out on the hills, the ice froze on the

sometimes lost their way for days in those wooded mountains.

Night came down after a cloudy day, an unusual thing in the Rockies. Our three hunters did not return. We had a late supper, and be-

lake, the clouds often hung about our cottage all day, so we packed our tents, like other Arabs, and separated for our many homes. Some day I am going back to rest at the Falls.

H. G. W.

TOLEDO, OHIO.

Lost Hunters' Camp.

We were camping in the Rockies one summer, just below the timber-line; moving camp occasionally, as the men wanted new brooks to fish in, and new thickets for grouse. One night we had pitched our tents in a little "park" at the edge of a great forest. In Colorado they call a meadow-like, open glade, a "park," altho it is free from trees. The forest of pines stretched out on every side of our "park," tall, dark and apparently limitless. In fact, one of the guides told us that the forest at this point extended for thirty miles in one direction and eighty in the other, practically unbroken, and without any particular landmarks to guide the hunter. It lay like a dark green blanket, folded over the lower mountains, range after range, alike as far as the eye could see. The children were warned not to stray out of sight of camp, as men had

gan to build a great bonfire to light the men back to camp. It grew later, darker; the fishermen came in with baskets full of brook trout, cleaned them for breakfast, ate supper, and gathered around the camp fire, that sent sparks up higher than the trees, altho they were giant pines. Still the hunters had not come. The fishermen grew anxious, and began to fire their guns, at regular intervals, listening for a response from the homecoming hunters. It was difficult to avoid thinking our shots were answered, as the open parks are full of wonderful echoes thrown back and forth by the opposite wooded slopes and canyon walls. At last we heard a far-off answering shot, and knew that the men were not far away. Two of the fishermen started out to meet them and help bring into camp any game, or it might be a hunter, who had met with some injury among the rocks. As they knew by the increasing loudness of the shots the men were at hand one of the mountaineers invented a little plot to find out whether the hunters were thoroly lost, or knew where they were. He scooped out a hole among the pine needles and

started a tiny fire of twigs, and, throwing himself down by it, was engaged in drawing off his boots when the tired hunters, guided by the shots and shouts, came up. "How far are we from camp, boys?" asked the leader, an old and experienced hunter. "Too far to walk all the way to-night. We will have to camp here till morning." And they lay down, exhausted and supperless, to wait for daylight. They had been wandering for hours, trying to find the way back to camp. One had climbed the tallest pine in sight before dark fell to see if there was any landmark to guide them, but he could see only the forest rolling away over one range of hills after another, an unbroken expanse of dark green velvet. They had carried

reassure the anxious wives, and have a huge joke in the morning ready for the crestfallen hunters, who would discover they had stayed all night only a few yards from camp. But they reckon unwisely who leave out that uncalculable element—woman! The hunters were just falling asleep and the fishermen had stifled their laughter and were about to steal softly back to camp, when a woman's voice was heard calling loudly thru the forest, and there was the near report of a gun. One of the hunters started up from his hard bed.

"That was my wife's voice! Poor girl! has she wandered out all this long distance to find me?" And he shouted reassuringly in reply. It was all up with the great joke; the fisher-

HOOKED.

no compass, as the sun usually shines in the mountain summer, and a wonderful sky of stars directs the hunter at night, but this had happened to be the exceptional cloudy afternoon. They had wandered in a circle until they heard the rifle shots of their comrades, and they were footsore and weary and hungry. But there was no help for it! They could go no further thru the black night of that trackless forest. They, too, with a sigh, took off their boots, and lay down by the little camp fire, beside the fishermen. The wicked scheme was for the men just from camp, who knew perfectly well how to traverse the short distance, to wait until the lost hunters were fast asleep, and then steal away to

men had to make a clean breast of their evil designs, and they were forgiven after supper by the hunters, who concluded not to stay all night a quarter of a mile from camp.

MAY PRESTON SLOSSON.

NEW YORK CITY.

A Vacation in a Portable Lodging House.

This is what we aimed at: To lead "the simple life"; be independent of hotels and boarding houses, as much as possible; see interesting parts of the country off the usual trail of sightseers; get away when we wanted to from the people and nerve-racking noise;

to hobnob with the silent people of the woods and fields, and to do this as inexpensively as we could—with comfort. First, we planned, snail-like, to take our lodging house along with us in the shape of a two-seated motor car; this was made to order, the body being inclosed by glass windows and doors; all the windows, excepting the front one, could be lowered or raised; there were dark shades to all the windows, and wire screens to be used in the land of the sportive mosquito and black fly; and all windows

would lock inside and doors inside and out. The back of the front seat was in two sections, which were hinged to the seat; a bed could be made by lowering these sections till the tops rested on the front of the rear seat, and a lounge, for day use, by lowering one section. The space under the seats was arranged to hold our few pieces of wearing apparel, gipsy kit of dishes, and a few supplies for lunches. There was a little ice chest attached to the bottom of the car, in which we could keep a small piece of ice, jars of milk, water and lemon juice, butter, etc. The trap door of the ice chest was in the floor of the car. We used steamer rugs instead of blankets, and these could be used over the knees during the day, or folded and laid on the seats. Two cushions served as pillows. We had hooks here and there to hang our day clothing on at night; and pockets in the upholstery to hold books, magazines, stationery, toilet articles, etc. There were cleats on the inside of each door, and a thin, strong board could rest on them, from side to side, making a table to write on or play a game of cards. We planned to have one substantial meal each day at a restaurant or hotel, if we happened to be near such. Our guide and road books told us where to look for them, and also for repair shops; and our other meals we took by the wayside, cooking over a gipsy fire, when we wanted a hot meal. Sometimes we bought a chicken or couple of squabs from a farmer and broiled them on a spit. We had a gun and fishing-rod along with us, and, when the season allowed, and small game came our way, we added many toothsome additions to our menu. We had both taken lessons in driv-

ing and caring for a motor car. Our car was not built for beauty or great speed, but for strength and comfort, so we were not troubled with breakdowns. We were always on the lookout for a quiet spot to spend the night, and often turned into some country lane or wood road and there, in our safe little lodging house, with the whispering of the pines for a lullaby, we stored up such sleep as only the nerve-tired can appreciate. So we loitered along from place to place, stopping sometimes for days in some extra attractive region, coming into touch with Nature in the out of the way places where she is at her best. The fashionable seaside and mountain resorts, with their round of social frivolity—just a repetition of city life—have no attraction for us; to our way of thinking this is the ideal way to spend a vacation.

A Hot Time.

I offer herewith a brief account of a fishing trip, with all interesting incidents, such as chicken-lice, rattlesnakes, a quarrelsome rancher, etc., omitted for the sake of brevity.

We tied blanket and frying pan behind our saddles on the evening of July 3d, and jogged down the canyon road that brought us, by a drop of 2,000 feet in six miles, from the temperate plateau to the semi-tropical valley of the Columbia. Crossing that "Achilles of Rivers" by the little cable ferry, we ascended the western bank. In the moon-

light the hideous ashy greasewood and sagebrush were mellowed into a weird witchery of beauty, and we gladly allowed the ponies their own gait. As a consequence, we reached the tiny village of Entiat at an hour when respectable citizens were abed. In the bunkhouse the loggers and mill-hands made merry, celebrating in anticipation the nation's birthday, and gave scant heed to our necessities. Left to our own resources we preoccupied a stable, and after caring for the horses, sought repose in the hayloft.

We were up at 4.30 next morning expecting to be far on our way before the heat became burdensome, but because of the holiday, breakfast was not served till 8.30. We had gone supperless

to bed and were ravenous. The heat was intense as we rode up the valley—110 degrees in the shade by the thermometer at a wayside ranch. It was almost noon when we reached our destination on Mad River. Alternate dousing of head and feet in the cold water of the stream soon refreshed us, and while my companion prepared coffee and bacon for lunch, I assembled our tackle. By nightfall we had more than enough trout for supper and breakfast. We gathered a deep bed of ferns by the light of our camp fire, and were scarcely rolled in our blankets before we fell asleep. Later I drowsily rejoiced to find myself partly awake, looking up at the brilliant stars of a dry climate and listening to the lullaby of the stream and the weird night noises of the woods.

Most of July 5th we fished, with moderate success, and toward evening were again in the saddle on our way back to Entiat. There we avoided the hay-loft and found pleasanter quarters under the open sky in the lumber yard. The ride up the canyon next morning

A WYOMING HUSBAND'S MONDAY DUTIES.

was terrifically hot, but I feel that I preached the better the following Sunday, and my companion testifies that his clients did not suffer by his three days' outing.

WALTER C. JONES.

BELLINGHAM, WASH.

A Yellowstone Vacation.

There is perhaps no better way in which to spend a vacation than by a trip to Wyoming and the Yellowstone Park. I took my family and we occupied a little bungalow style of cottage at the northern base of the Big Horn Mountains, a fine grazing and ranch country. The splendid trout fishing, abundant berries, extensive ranches, where all work was done by machines, the visits to the horse and cattle ranges, the round-up and day and night rides around the cattle, loading them upon the trains to ship to Packing Town, and the outdoor life in the invigorating air of 6,000 feet elevation, are enough to make the trip worth while. But there is more of novelty. The Crowfoot Indian reservation is only three miles away, and the country is full of Indians. Moses

Ride-a-Horse-with-a-White-Hip, Bad-Heart and his squaw, decked in elk-tooth garments, their papooses, and many others of the tribe were soon numbered as our friends, and so we became familiar with real Indian life, not only upon the road and at the store, but in their homes. Then, on the plains and mountains there was zest in finding bison horns and skeletons, as well as elk horns. There were caves and canyons to visit, and wild rides over the trails on Indian ponies. Wyoming is a woman's suffrage State, and this was a community of model husbands, as we learned whenever we went around on Monday morning, for at every home the husband was running the washing machine, the wringer, or handling the tub as good husbands always do. But on the temperance map we note that Wyoming is all black, and Colorado is only slightly gray with the dawn of freedom from King Alcohol, which has lightened so large a part of the map of the United States.

Last and best of all was the trip out thru the Yellowstone National Park, where all kinds of wild beasts and men live together and do not harm each other. There the beavers still build their dams and houses, deer, antelopes, elk, woodchucks and squirrels, all take a kindly interest in you as you pass. And black, cinnamon and silver-tip grizzly bears cheer and enliven the silent evenings by their visits to your tent door for offerings from your table.

The flowers clothe the mountain sides with richest cloaks, the grotesque rocks, deep canyons, grand waterfalls, marvelous geysers and formations furnish a fitting climax to a most enjoyable, health-giving, instructive vacation.

GEORGE DONALDSON.

CLIFFSIDE, N. J.

How I Obtained a Dinner at a Holiness Camp Meeting.

I arrived at the Holiness camp at Portsmouth, R. I., at 11:30 a. m. one bright August day a few years ago, and found the services in progress. The preacher was earnestly and eloquently pressing the claims for a more complete consecration of body and soul to holiness and to God. After the sermon the meeting was turned into a kind of a love feast, experience, testimony and song meeting, where they spoke of the love of God spread abroad in their hearts and full salvation, demonstrating by clapping of hands, jumping high in the air, waving handkerchiefs, with a religious abandon that was remarkable. To all good things there is an ending, and this was no exception. The loud ringing of the dinner bell reminded us of our hunger, and to satisfy the inner man we followed the multitude to the dining hall. When I arrived at the entrance and applied for a ticket, I was informed that there were no tickets for sale. The reason given was that this was a holiness camp meeting, and that they did not consider it right to

sell dinners on the Lord's Day, as they were not there for profit. With a feeling, both of disappointment and resentment, I passed along by some show cases, where pies and cakes were on exhibition, hoping to satisfy my hunger by purchasing the same, but the embargo was on the pies and cakes as well as the dinner. Passing out of the building, nearby I observed an old fashioned pump, with a tin cup hanging on a nail. The sight of it brought to my mind my boyhood days when I studied physiology, and there learned that our bodies were composed of three-fourths water; whereon, I resolved to drink copiously, in the hope that I would be sustained until the eventide. I was hanging the tin cup upon the nail when I saw approaching toward me one of the preachers who had taken part in the services. I thought I would chaff him a little, whereupon I addressed him thus: "This is a strange condition of affairs. A man leaves his home and family to attend a holiness camp meeting. After enjoying myself spiritually, my physical wants begin to assert themselves, for I am nearly seventy years old and, therefore, have a good appetite. I come to a place where there is plenty of food, only to be denied and turned down." He apologized by giving the same reasons that the doorkeeper had given. I called his attention to the fact that if they were there for the purpose of holiness, pure and simple, it would be well to consider the teachings of the prophet Isaiah, as taught in the fifty-eighth chapter, where he makes a fine distinction between the true and the false worship rendered to God and humanity, in these words:

Is not this the fast that I have chosen, to loose the bands of wickedness and to undo the heavy burdens, and to let the oppressed go free, and that ye break every yoke? Is it not to deal thy bread to the hungry, and that thou bring the poor that are cast out to thy house? When thou seest the naked that thou cover him, and that thou hide not thyself from thine own flesh? Then shall thy light break forth as the morning, and thine health shall spring forth speedily, and thy righteousness shall go before thee, the glory of the Lord shall be thy reward. Then shalt thou call and the Lord shall answer; thou shalt cry, and he shall say: "Here I am." If thou take away from the midst of thee the yoke, the putting forth of the finger and speaking vanity; and if thou draw out thy soul to the hungry and satisfy the afflicted soul, then shall thy light rise in obscurity and thy darkness be as the noonday; and the Lord shall guide thee continually and satisfy thy soul in drought and make fat thy bones: and thou shalt be like a watered garden and like a spring of water whose waters fail not.

All of which I delivered in as dramatic and as forcible style as I could command. As I finished my remarks, he put his hand into his pocket and pulled out a handful of yellow tickets, and, handing one of them to me, said: "There, take that and get your dinner; you are entitled to it." I took out my pocketbook to pay him, but he refused the money, saying:

"You are all right, you have earned it—now go and eat." Which I did, and enjoyed it exceedingly, for I was hungry. I would here say that I did not repeat the Scriptures for any purpose or idea that it would procure me my dinner, but was glad that the Word of God, even in this material sense, was "quick and powerful, sharper than a two-edged sword, piercing even to the dividing to the joints and marrow, and is a discerner of the thoughts and intent of the heart." It worked well for me, and I regard it as a sacred joke.

NEPTUNE DICK AND THE MERMAID.

Photograph by Roy Jones, Santa Monica, Cal.

Dick's Gang.

I was tired in body, brain and soul, weary of people and things and the ways of business. Accordingly I went to visit my sister in the pretty village of Jamestown, which looks out demurely over Newport Bay at her more frivolous neighbor across the water. There I met Dick. I had known him as a baby but nine years had gilded his head with sunny curls and filled it with an amazing fund of boy lore, which marked him as a perfect summer chum for a man who wanted to be a boy again. The grown-ups were jolly, companionable people, but I determined to cast my lot with the children, and Dick's "gang" adopted me and gave me a hearty welcome. There was a fat little John, with the manners of an ambassador, and Montgomery, from Georgia, familiarly known as "Gummy" and constantly attended by a big darky bodyguard, whom we called Will and invited into our secret councils, when we needed a vote to break a deadlock. There were others big and little, but Gummy, John, Dick and I were the real gang, and Will went with us. The day began early, for Dick went to bed with a string tied to his toe and hanging out of the window for John to pull soon after daybreak. True, I was not expected to appear till after breakfast, but then we were off to the beach to sail our boats. Dick was a man clear through, and defeat in a race was only a spur to new effort. Gummy was a cautious sport, and a sore loser, so that I had to be the arbiter of many disputes. When the sun and wind were right Dick led us to the Yacht Club pier to fish—that is, they fished and I baited hooks. In the midst of the morning, there came a glorious swim, where I shone as a Dolphin drawing a raft on which rode Neptune Dick, attended by a mermaid in the person of his sister Constance. But all the time I was in the joyous world of childhood, and the very springs of my being were refreshed. All you who are cursed with nerves go and find a boy and play away a summer with him.

ROY JONES.

SANTA MONICA, CAL.

Two Feet on a Fender.

The coming census will probably tabulate the names of more than one hundred thousand women who live alone in this United States of ours.

I cannot give the authority for the above statement. The scrap of newspaper upon which it was printed skurried in the door upon a gust of our May Day storm, probably dropped from the astonishing bill of one of my Kitty birds, who would surely scorn to line her nest with such a statement.

One hundred thousand!

I give you greeting, my sisters in loneliness.

Yes, you are lonely, you know you are. If not, you ought to be and need to awake to repentance.

I suppose many of you are dwelling in one room and pretending to make home about an oil stove; some of you have an apartment; others a house of your own.

I have two houses, one in the city and one in the country, and don't I rattle about in their emptiness!

Now, I am constitutionally opposed to loneliness, and two feet on the fender do not make home.

Do you want to know what I did last summer?

Borrowed four boys and turned them loose

in my country house. It was lively, I assure you, but it was home; whether they bunched on the roof to sing and whistle in the moonlight, or gathered about the big table to play games or read, or basked on the floor in front of the open fire.

When they were gone, the quiet and peace were blissful, but before long the peace became monotonous, and I hunted up another bunch for the winter. This last bunch was all done up in one bundle, a great, awkward lump of country gawkinsness, but how he did enjoy the advantages of the city schools and life!

For instance: Tommy Smith is the pride of his father and the joy of his mother, but they can't manage him. He grades 90 in lessons and 40 in conduct. He growls if asked to bring in a bucket of coal from the cellar or to go an errand to the store. He complains of his food, and his table manners in general are abominable.

This was all on June 29th. On the 30th he received an invitation from me to bring lots of fireworks and spend the Fourth. On July 1st he climbs my steps, his arms full of bundles and his heart full of courtesy. He stays over the Fourth, and then hates so to leave that I extend his invitation, and he remains all summer. He never forgets that he is my guest. No open is he important, no

A BOOKWORM'S VACATION

Photographed by Ray Jones, Santa Monica, Cal.

once does he complain of his food. He keeps his room tidy, helps cheerfully about the house, and even tries to sew on his buttons and mend his clothes. Once he frets a little about washing dishes, and I say, "Getting tired of staying with me, Tommy?" There is no answer, but there is no more fretting. When he leaves, I tell him what a nice little gentleman he has been, say I hope he is just like that at home, and invite him for another visit in the future.

The majority of children have too few adult friendships, and are too seldom invited into good homes, where the courteous part of their being is called into usage. I don't mean invited with their mothers. The responsibility of the being a guest should rest upon the child himself. Then, you can't do much with a child if his mother is near by.

Two years ago I had Susie Jones with me a part of the summer. She was fourteen and utterly beyond her parents. She *would* be on the street and *would not* wash dishes. Her distracted mother tried every new theory she heard of to influence the child, her father even used the rod; but she openly and vociferously defied them both. I invited her to come to me. She understood that she was coming in order to learn better ways. I had not a breath of trouble with her. She not only washed the dishes, but of her own accord washed a part of her own clothes, and sang merrily the while.

"Susie," I said, "I believe you like to do things."

"Yes'm," she laughed.

"Why didn't you do so at home?" Her face clouded.

"Mother nags me. She stands right by and makes me do *her* way."

Now here was an entirely unnecessary deadlock born of continuous friction. I wrote the mother, talked seriously to Susie, and sent her home helped over one crisis. Only last week I received beautiful letters from both the mother and child. So many children need to be away from home for a little and see their lives at a new angle, and so many mothers need the relief the child's absence affords.

My sisters in loneliness, a few weeks in your country home may save a wilful, reckless city boy; or a visit to your city home may lift the shadow from the heart of a restless country lassie, who is longing for just a little change. It is no small job—this raising children to be an honor to their country, and we childless women have a right to help the struggling mothers out a bit. It brings some trouble, of course, but it is a joyous trouble.

INEZ A. GODMAN

MADISON, CONN.

In the Oregon Woods.

As no Pacific Coast State was represented in THE INDEPENDENT'S vacation stories of last year, I hope this State may produce something of sufficient interest this year to warrant pub-

lication. Pioneer life on this Coast is rapidly becoming a matter of history, and it is not often that one can take an outing with a homesteader who is in a national forest, as well as upon Government land.

To tell you with absolute certainty where we went I should say our destination was in the Umpqua national forest, with Oliver C. Powell, homestead entryman, on the SE $\frac{1}{4}$ of SE $\frac{1}{4}$, Sec. 7, and the S $\frac{1}{2}$ of SW $\frac{1}{4}$, and SW $\frac{1}{4}$ of SE $\frac{1}{4}$, Sec. 8, Tp. 27 South, of Range 1 West, Willamette Meridian. And to reach it we took the stage from here to Peel, some twenty miles east, and from there pack horses after a short drive to the end of the wagon road, continuing our journey thirteen miles by trail up Little River.

Mr. Powell and one of the neighbors were living in his three-room log cabin, so we pitched our tent beside the cabin and a log storehouse, with the great unbroken forest to the north of us, and Little River to the south. First impressions have a great deal to do with one's enjoyment, and after our long ride a drink from the spring in the hillside and an afternoon's repast of grouse pie brought us to a realization that here, indeed, was something new and strange.

Deer were quite plentiful, altho we shot but two, a four-pointer and a two-pointer; and while we made no record catches, caught all the mountain trout we could eat, the largest measuring thirteen and one-half inches. Little River abounds in falls and rapids, and, as its source was but six miles further on, I fished the length of the stream for our best catch, passing but one house in the meantime. This took us into the Cascade Range forest reserve, created by President Cleveland, September 28, 1893. Here is an unbroken stretch of beautiful timber for miles and miles, and one has reason to rejoice that such a wise reservation was then made. No wild animals bothered us, nor did we bother them, having no dog, but one morning we discovered three fresh cougar (or mountain lion) tracks just outside the picket fence, those of a mother and her two cubs. What better vacation would you desire than such a one in the woods?

EDWARD R. FECKENSCHER

ROSEBURG, ORE.

The Minister's Vacation

One day the dear old deacons handed my husband a check for twenty-five dollars and said:

"Now, Brother, you're just tired out. Go off and take a month's vacation and at necessary *spend every cent of it.*"

The minister was obstinate. He called at home and refused to go unless I and the six children should go, too. We laughed at the idea. A month's vacation for a family of eight for twenty-five dollars! But at last we did it.

We remembered the old camp-ground, seven miles in the country, where annual camp meet-

ings were formerly held, the people gathering for miles around and bringing great boxes of provisions for a week's religious services in the woods. The "camps," mere cabins roughly built, were still standing in the great oak grove near the bluff by the big spring—the bold big spring which poured out of the bluff rippled across a rocky ledge, then down, in a sudden glittering plunge into the caverns of the earth. It is a wonderful spring, crystal clear and icy cold. Just to get a fine ripe watermelon from a neighbor's patch in the early morning, and hide it in the spring basin until noon, then all sit around on the rocks each with a huge slice cut "longways"! For three dollars a man hauled out the necessary supplies, a few chairs, a box of dishes, bedding, our old clothes, a tub and a broom. On top of this heterogeneous

noons of resting in the shadows, the rose-cheeked children swinging high among the branches and the returning health and vigor of the minister himself, but all these things make us long to go there again.

And of that twenty-five dollars there were left thirty-seven cents, to go into the missionary box.

EDDYVILLE, KY.

Ten Tramps.

Last summer a party of ten of us walked from Brookville, Pa., to Eagles Merc, Pa., a distance of two hundred and fourteen miles, in eight days, on one of which, however, we did not walk.

We were each equipped with a tin cup, a

THE TEN TRAMPERS RESTING BY THE ROADSIDE.

Photograph by M. A. Gordon, Brookville, Pa.

load clambered the children, while behind, with a stout rope, we tied the reluctant and exostulating cow. When we overtook them the wagon was progressing slowly, the cow, like Prometheus, still unconquered, was delaying things considerably, and the children, scattered over a half mile of roadway, were gathering blackberries and shouting at the top of their voices. Their vacation had begun.

The moving into camp was a delight. The beds, wide shelves against the wall, were heaped with fresh, clean straw, a heavy comfort next the usual bedding. A hasty supper in the "lean-to" open dining room on the long board table with the benches on each side, then rest—such rest! like the weary children, we all slept nightlong in the beautiful quiet of the forest. I wish I could tell you of the drives thru the country, the visit from kindly farmers and their families with choice gifts of chickens, honey and watermelons, the long after-

noon pair of blankets and a rubber poncho, and were dressed in corduroy trousers, flannel shirts, light shoes and felt hats, tho I would advise any one contemplating such a trip to add leggins to the list as the amount of dust they keep out more than pays for the extra heat caused by them.

Eagles Merc, our destination, is a small, quiet resort on the Lake of the Eagles, a beautiful little sheet of water situated at the summit of one of the highest peaks of Pennsylvanian Alleghenies, where we spent a most pleasant two weeks. We had many odd experiences along the road, not the least of which was our having to seek shelter for the night in the loft of a livery stable in an inhospitable town, or tramping eight miles over the bare back of a mountain ridge in the blazing sun without water; but these are the kind of experiences which can easily be avoided by the careful traveler. The only in the walk we

learned that axiom of the road, "Never trust distances to farmers and guide posts."

We arrived at our destination a little ahead of time and all feeling better and stronger than ever before, as brown as berries and as hungry as bears, and all vowing to do it again next year, which we still expect to do if nothing prevents. The entire cost for the trip for each man was twenty dollars, the average cost per day being fifty cents while walking and the balance being spent in hotel bills and the return trip which was made by rail.

GEORGE WILLIAM MEANS.

BROOKVILLE, PA.

A Vacation and the Baby.

The baby was six weeks old and plenty old enough to come home and visit his grand-parents. As he was the only grandchild in my family and the only grandboy in his father's, he was a wonderful bit of humanity, "and you must come and stay all summer and have a good vacation, and we will wait upon you and little Allen." Of course we went. That journey home, ninety miles, will I ever forget it? Such a wonderful baby, everybody seemed to notice him, and I suppose also my pale face, but I didn't know it then, and how happy and tired I was when the brakeman called the station, and my father, mother and young sister were there to meet us.

We marched triumphantly thru the village streets, the observed of all observers, I supposed! tho many people, I later learned, did not notice us. Our vacation had begun.

That baby had passed six weeks of his existence according to rule—his father is a physician—and tho it was contrary to both grandmothers' ideas, I intended to continue. But when the friends and neighbors came in he was handled and cuddled and coaxed to laugh until he dropped to sleep from sheer exhaustion.

That was Tuesday, and the next Friday was the Glorious Fourth. All of us—uncles, aunts and cousins—were invited to the farm to spend the day. So early in the morning my father secured a livery rig, and we drove the three miles. Of course, my husband, country-bred, knows something of horses. My father, knowing nothing of them, has all self-confidence, and when Thad suggested balky, father poohed at the idea. Well, we spent a glorious day, but along toward evening the baby developed an attack of the colic, and such excitement and commotion!

Everybody suggested a different remedy, but Doctor stood firm, just heat was sufficient, until his mother appealed to me, and said if Thad was so foolish she hoped to goodness I was not. Hitherto my confidence had remained unshaken, but the thought actually flickered that maybe the older women knew more

about a baby than a young doctor. By eight o'clock I was half mad at everybody, and they were all mad at us. Meanwhile a terrible thunderstorm had spent itself and when we started home the roads were running with water.

We splashed and floundered along, my father driving, until about half way up a hill, when the horses stopped. They stood for a few minutes and then began to back, my father urging them on, Thad shouting for me to get out, and mother saying to sit still. I, holding the precious Allen, was naturally in a state of excitement, when the animals decided suddenly to go ahead. Then father plunged boldly in across road, and such bumping, lunging, jerking and pulling! It was enough to make one gasp for breath. I knew Thad was fuming, and that gave me an uncomfortable feeling, when suddenly upon emerging into the main road we were nearly overturned. Thad sternly commanded me to get out, so out I got, baby and all, and with a quick start and run, the carriage was some distance ahead. Then giving Allen to his father, we trudged thru the mud. It was very quiet after we again got in the buggy, and when I looked to see if Allen was all right, I found his feet where his head should have been, and we have always accused the over-anxious father of carrying his son some distance head downward. Well, we stayed two weeks in town, two weeks in the country and one with an aunt. We came home tired, no good habits formed, and with the whooping cough. I now hold that the best place for a lady to take a vacation is at home.

F. W. ASHLEY.

FAIRMONT, W. VA.

Go to the City.

My work being in towns of from one to two thousand population, and being limited both as to money and to time, the "vacation" question, to me, is one of much interest. I have read much and have experimented some, as to the various possibilities of a pleasant and profitable vacation for one who is comparatively limited in opportunities. In my latter years I have decided that for both pleasure and profit the city is the place for me. Not cities in general, but certain cities such as Boston, New York, Washington or Chicago, all of which I have tried, but late years have had about an equal liking for New York and Washington.

To me the cities mentioned are equally desirable as places to visit, winter, spring, summer or fall. The parks, suburban trolley rides, cool reading rooms, etc., make them desirable in summer, even as in other seasons.

Then there is so much to see that is both pleasant and profitable. What a treat are the libraries, art galleries and museums! How stimulating to come in touch with and feel the heart-throb of the nation! Living in the city tires one, but visiting the city is different altogether. The former fags out the nervous system, the latter quickens our intellect and

awakens it to delightful sensations of life and possibilities.

I also find the "cost" more satisfactory than the mountains or the seashore. The accommodations and board are more reasonable in the city than the other places mentioned. The city hotel and boarding house have about them a sense of permanency, stability that is pleasing and restful, which is lacking in the summer hotel and boarding house.

J. T. RICHARDSON.

ROCK HALL, IND.

Three Days in a Launch.

I don't know whether you would like for a little colored boy to tell you about his vacation or not. A family took me with them to Florida this winter. I tell you I had a dandy time! In January they hired a launch for three days and took me with them. When we left St. Augustine you could see the Anastasia Lighthouse away up over the trees in the fog, with its big black and white stripes winding down. We past thru the drawbridge and went on down the Matanzas River. The Matanzas River is not a real river, but an inlet from the ocean, and is the river on which old Fort Marion stands. We sailed on down the little, crooked river till we came to the oyster beds, where the birds, such as cranes and pelicans, were making their supper. This made us want some, so the captain and I got out in the little rowboat and gathered some of the biggest. In this same place the captain last year dug about one hundred human skulls, which are supposed to be the skulls of the Frenchmen, who were wrecked and appealed to the Spaniards in Fort Matanzas. The Spaniards promised to help them and went after them in rowboats; then killed them all. The old fort was just across from where we got the oysters.

We landed soon after and the captain and I got some brush and started a fire, then put on the oysters and they started to popping like pistols. While we were eating them the moon rose. The funniest thing was that the captain, while eating an oyster, got a good mouthful of cooked pearls. After we were thru with the oyster roast we got on the boat, pushed it off into the middle, and anchored for the night. All night we could hear the water lapping beside the boat and the surf roaring right across the narrow island.

The next morning at sunrise we saw a school of fish going by. The captain got out his net and I rowed the boat while he threw the net. We caught some fine mullet and had them for breakfast. There were two rivers we

had to go thru, Matanzas and the Halifax, and they were connected by a canal thru which we had to pass. It was certainly beautiful scenery, with big walls of dirt on either side and palm trees hanging over the water. Presently we past the dredge boat. It was the queerest thing I ever saw. It looked like it was going to sink. When we came to Mosquito Inlet we went up a little winding creek for bait and then went to our fishing ground.

After fishing for about ten minutes the captain caught a pig fish and made it grunt. What do you think I caught? A balloon fish. The captain scratched it on the stomach and made it swell up about four times as big as its natural size.

Then we came to New Smyrna, and, O, dear! it was the end of our trip. You may be sure we were all sorry. I hope every INDEPENDENT boy who goes to Florida will coax his folks to take a launch trip on the inland rivers.

WILBUR RICHARDS.

MADISON, CONN.

A Home Vacation.

Have you ever visited yourself? No. Then you have missed one decided pleasure in the gamut of vacation experiences. After two summers in California and Pennsylvania, my dear daughter and I wished thoroly to enjoy our own home and shady yard, which is really a part of the park. To this end we took our meals four doors away, so that we could revel in the early morning sunshine and fully enjoy the sunsets without any worry about our daily bread beyond the enjoyment of the finished product.

To swing for an hour after breakfast perfectly idle or with a book in your hand, to train the vines and work among the flowers, to watch the birds and squirrels, to take your siesta without any visions of dish-washing and final kitchen tasks, the cool, fresh dress for tea, after which to bring the phonograph either to the front porch or the lawn and with music to banish "the cares that infest the day"—these simple pleasures may seem exceedingly tame after some of the more gorgeous vacations; but, for solid comfort, go you and do likewise.

With all this surfeit of time we were by no means idle; we merely suited our time and pleasure to the work. No meals meant comparatively little indoor work; that was usually dispatched early in the day. This extra leisure gave me opportunities for renovating and tinkering and the thousand and one jobs that accumulate in every home against the time "when you have nothing else to do." With a shady back-yard and a vine-covered tent (built of second-hand gas pipe and poultry-netting) one really took pleasure (and pride,

THE LIGHTHOUSE.
Photograph by Wilbur Richards, Madison, Conn.

too) in turning off these left-overs. Among other things I removed paint and varnish from chairs, waxing them; reupholstered a set of furniture; re-tufted three box mattresses; made buttonholes galore, and much accumulated hand work.

With an occasional trolley ride, a day in the country and restful nights on a screened-in porch—could one help being refreshed and ready to take up active work in September?

M. F. M.

SPRINGFIELD, ILL.

A Summer in the Country.

How to have the greatest benefit and pleasure for all the family from the vacation was the problem that confronted us last summer. We are sure that we solved it, and instead of a few weeks' vacation at the seashore or in some distant mountain or lake region, we spent our whole summer near home and for the same outlay of money that a short vacation had often cost us we had four months of solid pleasure that was participated in by all, father and mother, small boy of six, four-year-old twin girls and the maid, to say nothing of the dog, and this is the way we did it:

We found a little old house with an acre of ground in a pleasant country neighborhood, four miles from the city and near some of our friends who had been rustivating for several summers. To be sure, we had to rent it for a year, but the price was not exorbitant, considering the fruit that was on the place. There were six rooms and in one a large fireplace which had been bricked up and plastered over by some unsentimental soul. It didn't take us long to open it and we had a cheerful wood fire on many a chilly evening. We moved out only the furniture we absolutely needed, and as we were not on a car line bought an old horse and buggy with which my husband drove into and out from the city.

Our first attempt at a vegetable garden was so successful beyond our wildest hopes that we feel like telling every one how much enjoyment and return we had from the very little money spent in seeds and small plants and the healthful outdoor labor of hoeing, weeding and carrying water. We had to hire a farmer to prepare the ground and plant the seed, but we

did all the cultivating ourselves and were fortunate in having low-lying ground for the garden, which was comparatively moist even in the drought of last summer.

Everything we raised was delicious and we had such an abundance that we often sent vegetables in to our friends in the city. Our supply of splendid green and yellow string beans and peas seemed to be never failing and the memory of those lima beans and that sweet, tender corn lingers yet. We even had melons as good as any Rocky Fords we ever tasted, and what fun it was to pick all these things and bring them fresh to the table!

There was not a dull moment all summer. While the garden was starting, we busied ourselves with the chickens and the one little pet duck that we raised. I had plenty of time for reading and sewing. The children played outdoors all day in the barn or the swing, making mud pies in the orchard or wading in the creek at the foot of the garden. They fed the chickens and hunted the eggs and grew fat and brown in the open air. There were the cherries to pick and later the apples and plums. Sometimes we took our lunch and went black-berrying, and often had little picnics with our friends who were near. We always ate our Sunday night supper in our neighbor's meadow back of the orchard.

On the Fourth of July we, "city farmers," as we called ourselves, had a fireworks display and served cake and ice cream to many of the real farmers who in turn invited us to their country dances. Often on Saturday nights the men went coon hunting and one night, shortly before we came back to the city, we had a corn roast in a great fire in the bed of a stream gone dry. Besides roasting the corn we broiled bacon on the coals, fried eggs and made coffee. Our hostess had for dessert a huge watermelon with twenty-one candles burning on it in the center of the table, to celebrate the birthday of a young lady who was a guest of one of us. You may be sure we always had plenty of company, many of whom are anxious to try a summer in the country, being willing to leave behind the city conveniences which we left with such misgiving and for which we found such great compensation.

Making a Tent Home Livable

BY EDWIN S. AND CORA L. POTTER

HOW to provide a home for ourselves and two children on the shortest possible notice and with the least possible expense was the difficult problem that confronted us one morning in March, two years ago, when fire, that most effective of all spring housecleaners, relieved us suddenly of all our worldly possessions. The very completeness of the loss gave a new twist to our previous conception of the "simple life," and, after considering many plans, we finally decided to try camping for the summer.

Thru friends we learned of a beautiful tract of farm and wood land, the owners of which had bought with the idea of selling or leasing home sites to a few families having interests and ideals in common. Tenting privilege was offered to us on this place, and as it was within commuting distance of the city, an essential in our case, and offered the promise

of congenial neighbors, we gladly accepted and went to work with a will to make a tent home livable.

Both of us had experienced in youth the kind of vacation "camping out" which involves a vast amount of discomfort in the way of dirt floors, hemlock beds, ineffective mosquito protection, heroic camp-fire cooking, and suffering from cold or dampness. But we had no intention whatever of inflicting upon ourselves and little ones hardships and inconveniences of this kind for a half-year period.

During that first summer's experience we did eliminate most of these discomforts, notwithstanding the necessity of extreme economy, in view of our recent loss. And in most respects it was the healthiest and happiest summer we had yet known. By doing, we were learning what was essential and how to provide it. It required one season, however, of ex-

THE CAMP.

An early morning breakfast is being served.

VIEW FROM THE CAMP.

Gateway to The Highlands. Dunderberg on left, Anthony's Nose to the right of the bend

perimentation to enable us to make a tent home that seems worth telling about.

Thus, with the opening of another spring, we "drove stakes" where we hope to make our permanent home on a few acres of our own. The house we plan to build there will be a wintering supplement to our tent home, rather than the opposite, so charmed are we with camping for the warmer six months.

The spot selected was a level, shelf-like summit of a jutting crag, the first of a series of rocky promontories forming the southwestern side of a mountain overlooking the Hudson. From our tent door we have a magnificent view of the river, three miles away. While the most convenient location for a camp is undoubtedly by the side of a stream or near some other good water supply, we preferred to sacrifice this point in order to have elevation for our tent and consequent fine view.

Our water supply was a small mountain brook which flowed unpolluted from a series of springs on a neighboring hill top, and after traversing a level, sunny clearing, plunged into a wooded gorge

about twenty rods distant from the camp site. With axe, brush hook and grub hoe, a smooth path to the brook was made to a place at the edge of the clearing, where the sun-warmed water swirled thru a natural basin, which made us a good "bath tub" and reservoir from which to dip water. At the side of the pool we made a platform of smooth boards, with seat and railing, for use in bathing and dressing. There was a box for keeping soap and brushes, and on the limbs of nearby trees the towels hung and dried and bleached in the sun. The spot was so completely secluded and distant from frequented paths that there was no need of a bath house, and the sunshine added wonderfully to the pleasure and invigorating effect of the daily cold bath. To the children especially this kind of bathing was a delight. A wash bench near the pool took shape next, and here the laundry outfit was kept and the washing done. Drying lines were strung between trees in sunny openings near, and the clothes were not taken to the tent until dry. Drinking water was carried once each day, in the

early morning, from a spring which came directly out of the ground a little farther down the gorge and was nearly as cold as ice water. It was kept cool in the camp cellar.

The cellar, always an important detail in rustic living, especially when one is located far from an ice supply, was dug into the steep hillside back of the tent. The stones unearthed formed the enclosing walls, which supported a canvas-covered board roof, over which earth and sod were laid. The board door in front opened on a level with the sloping

FRONT OF TENT,
Showing screen door and cellar.

ground, the floor of the cellar being about six inches below the door sill. Here on the hottest days the temperature was never above 55 degrees. It served the combined purpose of pantry and refrigerator.

About twenty feet back from the edge of our rocky ledge we cleared away the bushes for the largest of our two tents. This was a fourteen-foot-square, twelve-ounce army duck hospital tent, which cost at second hand \$20. It was so constructed, with five-foot walls and extra high ridge, that every part of the floor space was available for use. There were large openings in both ends and along the sides was a deep flap sewed to the walls about a foot from the bottom. This we

drew in and tacked securely to the floor, while the edge of the tent proper hung below the floor on the outside to carry down the water when it rained. Thus it will be seen that, with front and back flaps tied down, our tent could be made perfectly secure against rain and wind storms, and with our screen door and net arrangement we were able to keep out flies and mosquitoes. We added to this a new fly at \$10 and a new 7 by 9 tent and fly at \$15, which, with an extra piece for a back door awning, made the total outlay for canvas \$50. The smaller tent was necessary as a rainy day playhouse and as an extra sleeping place in the event of company.

Our kind neighbors at the farm exemplified their co-operative ideals by helping us to get our materials up the hill and by making merry the occasion of the house raising. The floor, consisting of 8-inch groove and tongue pine boards on 2 by 4 joists, came to just \$11.60. The joists rested on stones and the boards were cleated together in portable sections. The floor when laid formed a firm brace against which the upright poles could be nailed to give greater rigidity to the tent frame. A center pole was thought necessary, and by choosing for this a nice, straight tree and not cutting the limbs too close, we had incidentally a fine hat rack. The guy ropes of the tent were not pegged down in the ordinary way, but were made much more secure by tying them to a stout pole, which was then laid on the ground at the proper distance and kept in place by being braced against strong stakes driven into the ground at the ends. Strong ropes stretched taut from front and back poles to growing trees made us perfectly secure against heavy wind storms. The rope at the back served incidentally as the ridge for the awning which covered our dining-room.

The tent being up, we put into execution a plan we had devised for making it actually mosquito and fly proof. By nailing the upright poles to the floor we had one right angle to begin with, and there seemed no reason why, with another upright, a top and bottom piece, we could not have a frame which would support a regular screen door. This we tried, and stumbled upon what we regard as our greatest invention and addition to

camp lore. The tent flaps were fastened as far back as they would go and the remaining space filled by tacking strong mosquito netting to the door frame and the floor, and sewing it at the top and side to the canvas. (See picture.) This arrangement, while giving the maximum of light and air, gave also a sense of security and protection which the ordinary tent does not afford. A hook on the inside made it possible to guard against intrusion when desirable. The net in no way interfered with the instant dropping of the tent flaps when necessary to shut out wind or rain or inquisitive gaze. For additional light on dark days we cut a square window in the side of the wall exposed to the south, rolling the canvas up and buttoning like the curtains of a carriage.

We were now ready to furnish our home and organize our housekeeping. We had resolved that the work should be reduced to a minimum, with the elimination of the drudgery connected with a superfluity of things, with dark corners and uncomfortable working apparatus, etc. Also we would so simplify our living as to need no servant. In other words, we would make our summer a perpetual picnic and have lots of time for reading, resting, and the proper care and training of the children. The word picnic suggests at once wooden plates, paper napkins, tin spoons and a certain amount of crumbs and litter left around for the birds and the winds to dispose of. But to make it a "perpetual picnic" these difficulties had to be overcome. We found the wooden plates expensive or unsanitary. The tin spoons would rust and the paper napkins would take to the woods on the wings of the wind. So we soon got down to a solid foundation, with heavy blue and white enamel dishes, inexpensive silver knives, forks and spoons, and for a table cover a dark green oilcloth, which harmonized nicely with the foliage about us. For, of course, we ate out of doors whenever the weather permitted. The awning at the back of the tent afforded shelter from the sun and from ordinary rains, and there our table could be placed when not desirable to set it out under the trees. The ground had been leveled and smoothed, and the surface was so hard that it could be sprinkled and swept like

a floor. Near by we built a table for dish washing, and for the first time this much dreaded occupation became almost a pleasure. The table was made just the right height, so that there need be no back bending, towels were dispensed with in favor of the more sanitary plan of rinsing and drying in the sun in a wire draining basket, and—what if you did spill a little dish water? Close by was a low wash bench, where were kept pails of water, basin, soap, etc.

Most of the cooking was done inside of the tent, tho we did boil a pot of potatoes or corn occasionally on an outdoor fire, just for the fun of it. There was an alcohol cook stove in the kitchen corner of the tent, supplemented by a small oil-lamp stove. These were placed on a standard made of a packing box, in the bottom of which we kept grocery supplies. A semi-circular zinc screen made a very effective protection from air currents and served to confine the heat. A rack of shelves for dishes, draped in front with curtains on wire, completed the furnishing of the "kitchen." The corresponding corner at the front end of the tent was our sitting-room and study. Here we had a writing table, bookcase, typewriter, rocking-chair, etc. The opposite front corner was curtained off with burlap strung on wire as a bedroom and dressing place. A large bureau, a spring cot and a low chair furnished this space. It was "the mother's room," or could be offered to a guest.

In the fourth corner stood the masterpiece of hand-made rustic furniture, of which we were pardonably proud, as amateurs. It was a two-storied bedstead, seven feet long and four feet wide, the corner posts of which were four strong young tree trunks, with branches so curtailed as to afford convenient clothes pegs and to be used as steps for the children to their upper berth when the Sand Man drove them to roost. There they slept, feet to feet, and were secured from rolling out by a board which swung up on hinges and fastened with hooks. The bed ticks, filled with fresh, clean straw, rested upon springs made by nailing slender saplings to the cross pieces, the latter being mortised into the corner posts and screwed fast. Boards nailed on either side kept the mattresses in place, and together with diagonal braces,

THE TWO STORY BEDSTEAD.

gave to the whole structure the necessary rigidity.

There was no danger that the commuter would oversleep in the "first story" of this bed which he had made and was glad to lie in, for the youngsters overhead were sure to wake with the birds, and often his first waking vision was that of a pair of little brown legs reaching down wildly for the pegs in making their descent.

"But how can you stand it, living so in a tent when the mornings are frosty, and when the long, chilly rains come in May or in October?" ask many incredulous or timid friends. The answer sufficient is contained in a little sheet-iron, air-tight drum stove which the commuter got for one dollar at a Jersey City factory and carried home on his back one rainy night, during the first season's camping, together with five lengths of stovepipe. The latter cost another dollar. The stove was placed on flat stones near the back pole of the tent and the pipe extended up until near the ridge-pole it past out thru a hole in a square piece of sheet iron nailed to the upright pole and thru a small, wire-screened window in the gable of the tent. Another elbow on the outside supported by a wire to the top of the tent-pole gave us a vertical section protected by a weather-vane cap to prevent back draft. A few bits of wood at hand from the chopping block made a quick blaze, which made the whole interior of the tent comfortable in a few minutes. Rainy weather had no terrors for us henceforth.

There was plenty of room left for extra camp chairs and for the eating table

when weather drove us indoors. And when some bright rag carpet rugs were finally laid down as one little touch of "luxury," the whole effect was most comfortable and pleasing to behold. At night the interior was lighted by a large kerosene lamp and reflector in a swinging iron bracket, fastened to the center pole so that the light could be thrown into almost every part of the tent.

We had now begun to "live," and next turned our attention to the equipment of an outdoor place for the children's play

THE "MOTHER'S" ROOM

and development. The nature of the ground and location of trees suggested swings, hammocks, a trapeze, a see-saw, and these were put up first. Then a small carpenter's bench, with screw complete, was made in the shade of a tree, and a chest of small tools provided. Here many hours were spent by our little man, who got his first lessons in the science of numbers by measuring off boards and sticks with the little rule which he carried in his overalls pocket. A garden patch was spaded up for them at the foot of the hill and a set of good, strong garden tools and sundry packages of flower and vegetable seeds gave incentive to their first agricultural activities. Home-made boats to sail in the brook, where they went to play at will, and a magnifying glass thru which to examine the new plants and insects, gave them a healthy curiosity about the streams and woods. A "house in the tree" early took shape, suggested by a peculiar clump of five chestnut trees growing up from one root near the tent, and a pulley-rigged rope hanging from this, which they soon

learned to go up hand over hand, was another great muscle developer. A basket attached made an elevator, and many a picnic lunch was sent up and eaten among the branches with great delight. The only thing lacking was playmates of the proper age for our two, if we were to get the very most out of our summer in the woods. So, early in the season, when a friend called with two fine boys who were greatly taken with our way of living and begged not to be taken back to their conventional boarding-house, we were very glad when our offer to care for them for the summer was accepted. These and visiting children made a happy group, the care of which, with our arrangements, was reduced to a minimum. For instance, white bed sheets were dispensed with in favor of thin, gray cotton blankets, at 50 cents a pair, which we found much easier to wash, needed no ironing and did not show superficial dirt. The children went barefoot most of the time, never wore hats,

were brought to us once a week when some one drove to the nearest town. Some little extras were brought from New York by the commuter in the case, and, be it said, without grumbling. Commuting from this point required an hour and twenty minutes on the train and a mile walk "across lots," but this was never unpleasant, as much reading and work could be done on the train in this case, and the reward at the end more than justified the effort.

Having lived under such conditions as these, is it any wonder that we have no regrets at giving up our winter quarters in the noisy city to return to our life in the woods? Again to climb the rugged, winding mountain paths, to breathe the pure, fragrant air, to feel the uplift of the distant view! Again to bathe in the little brook, to behold the joy of the little ones as they rediscover familiar haunts! Again to gather with kindly neighbors and friends around the sociable camp fire, singing the old songs, telling stories or discussing weightier matters! To lie in the hammocks under the swaying hemlocks and watch the play of moonlight on the river far down across the dusky tree tops, the mighty current giving us a sense of nearness to the populous cities past which it flows! To await the passing of the "night boat," whose powerful searchlight sweeps the hillsides, often flooding our camp with its brilliant whiteness! To feel once more

"The sense of freedom and nearness of earth."

When we think of these things we feel that we have taken a long step toward the solution of our home problem—at least for half the year.

NEW YORK CITY.

THE CAMP'S KITCHENETTE.

and the chief article of clothing in use was a pair of overalls or a one piece cotton bathing suit. Arms, legs, chests and little backs went bare to the sun and wind, and a fine little band of Indians we did have before the summer was over. There was not a single case of cold or other sickness during the entire summer. Meals were served to the children three times a day at their own little table out of doors, with plenty of fresh milk, fruit, cereals and vegetables, but no meat. Milk, eggs, vegetables and some fruits were bought very cheaply from neighboring farmers, and the rest of our food supplies

THE STUDY

Literature

The Wide, Wide World

THIS country has not yet been discovered by the international tourist. Distinguished visitors come to us, but their purpose is a different one. The beauties and wonders of Nature of our broad domain do not lure them primarily, tho they may learn to appreciate

them as they unfold before their eyes. They are almost invariably investigators, students of ourselves, our institutions, our gigantic activities, our civilization—of what we are doing here, not of what Nature has done for us, except economically. A visible historic background of monument and building we have not, and we are no longer "picturesque"

THE GIANT MOOSE.

"FROM THE DECK OF THE SHIP THE TUG LOOKS LIKE AN ANT
DRAGGING AT A HUGE PREY."

From Curwood's "The Great Lakes." (Putnam's.)

since the disappearance of our frontier. We ourselves dominate our country in a way impossible in storied Italy or England, Germany or France; our background, our perspective, lies still in the future. And so, the distinguished visitor returned home writes his book about America, which is all about us and but incidentally about our splendid setting of wood and river, of mountain and plain, from the subarctic to the subtropic zones. Our battlefields he ignores, the State House at Boston, Federal Hall, Mt. Vernon, the Californian missions, barely arrest his attention. And about that background of ours, which lies in the future, he usually has his doubts, tho he may refrain from expressing them. Books of travel on America, pure and simple, from foreign pens, continue to be exceedingly rare.

Nor can it be said that the American tourist has as yet discovered his own country. Europe continues to lure him. Americans there have been and are a-plenty who roam among our historic spots with seeing eyes, who wander into the country of the *habitants*, or the lonely places of our mountaineers, who float down the Hudson or the St. Lawrence, the Columbia or the Mississippi, and bring away from them books full of charm, and color, and atmosphere, and

grandeur; but they are as one preaching in the wilderness, for, having their books, Americans in their multitude continue to elect to travel abroad by preference. And they continue to rush into print with more and ever more accounts of long familiar sensations and impressions, of the awakening, so commonplace today, at least in books, of a vacation trip among the cathedral towns, the castles of the Rhine, the chateaux of France, the cities of Italy.

A work well calculated to invite to travel at home is Mr. James Oliver Curwood's *The Great Lakes*,¹ and yet, at the very outset, one finds here but another corroboration of the statement made above, that we dominate our background, that our perspective lies in the future. The American has not yet "discovered" the Great Lakes, complains Mr. Curwood, and he is right. Yet behold, already, before the tourist has found time to go to them for their beauty and grandeur, for the marvel of these enormous fresh-water seas, they have already become highways of commerce and industry. Business before pleasure. It is as servants of our ever-growing wealth and prosperity that the author chiefly

¹THE GREAT LAKES, BY JAMES OLIVER CURWOOD. 1908. New York: G. P. Putnam's Sons. Large size. \$3.50.

deals with them, which is as it should be in a volume of the "American Waterways" series. Astounding figures he gives, and sketches of modern giants—giants of commerce, still in the flesh, still active, still building, organizing, expanding; but he has an eye for the picturesque as well, he tells stories of heroism amid dangers greater than those encountered on the ocean itself, and his

present-day shipping and the growth of its ports. This brief *Story of the Great Lakes*¹ is abundantly illustrated.

The third American book on our list is a new edition, with additions, of an old one, with a new title, Mr. Walter Dwight Wilcox's *The Rockies of Canada*,² the third issue of his "Camping in the Canadian Rockies" in less than ten years. The book deserves its lasting popularity, for

COURT, PALACIO DEL INFANTADO, GUADALAJARA
From "Builders of Spain," by Clara C. Perkins (Holt)

manner of telling has an enthusiasm that is contagious. But again we ourselves, our material achievements, are first; the Lakes are but our servants.

Mr. Curwood briefly outlines the history of these Great Lakes, from their discovery to their development as highroads of commerce. Prof. Edward Channing and Marion F. Lansing devote an entire volume to this side of the subject, from La Salle to the beginnings of the Northwest after the Black Hawk War. A third of the book is given to the commercial development of the region, to the turnpike, the Erie Canal, the railroad, the

it is useful, and a guide to natural beauties that some day will count their annual pilgrims by thousands. The illustrations are all that can be desired, more eloquent than any words that can be said here. The author has revised the text, rewriting a considerable portion of it. The map is one prepared by the Canadian Department of the Interior.

The Mexico that is disappearing before the leveling approach of a uniform civilization, the Mexico of the little villages away from the railroad, where the promoter is not and whither the investor is not tempted, the old "New Spain,"

finds a chronicler, perhaps one of the last, even tho progress there be slow, in Mr. Stanton Davis Kirkham, whose *Mexican Trails*⁴ is a record of a three years' sojourn in the country, much of the time being spent on horseback and among the Mexican Indians.

Excursions to Mexico as well as to Cuba, Porto Rico and Alaska are included in the new edition of *Baedeker's United States*.⁵ This is just as useful to the American, whether he travels or not, as it is to the foreign tourist for whom it is primarily intended. A copy of it ought to be put on the reference shelf of every reading room along with the dictionary, the encyclopedia and "Who's Who."

And now abroad. *The Spell of Italy*⁶ again—of course. Caroline Atwater

of fiction, which, if it have neither originality (what that is new could possibly be said at this late day of Italy?) nor great scholarship, is at least conservatively sound in the quality of its information, and readable as the record of somebody's intellectual "good time," tinged with the inevitable enthusiasm. A beginner who happens upon this volume will at least not waste the hours bestowed upon it.

The *Walks in Paris*⁷ of the curator of the Musée Carnavalet, M. Georges Cain, has been translated into English, and proves to be a veritable treasure-house of information about the Paris that has disappeared, or is doomed to disappear, on both banks of the Seine—the old Paris of history and of the historical novel. Each quartier, each street, each

senet, from Molière to Sardou—Sardou, lover of old Paris, and M. Cain's companion on many an expedition of exploration and identification. The illustrations, from many sources, are as curious as the text, which should be dipped into here and there in idle moments, not taken at a sitting.

Two works, in four volumes, uniform in binding and general make-up, apparently herald the beginning of the publication of a new "series" of travel books, with architecture as their common subject of chief interest. These books are sumptuous in every mechanical detail, excellently illustrated, and written in the service of the popularization of the one art that has longest awaited the popularizer. *French Cathedrals and Cha-*

teau history from the architectural point of view, tracing successive influences and developments. While France hardly stood in need of such treatment, Spain certainly did, so far as the general reader is concerned, to whom the books may well be recommended.

Mr. F. Hamilton Jackson, R. B. A., completes his elaborate and scholarly work on *The Shores of the Adriatic*¹⁰ with a second volume devoted to the Austrian side. This is one of those solid undertakings which, once completed, stand for years as the absolute authority on their subject, unlikely to be superseded, rendering, indeed, further literary exploitation of it unlikely, except for additional discoveries and finds. Archeology, architecture, the decorative arts (especially

maining in the Europe of today. And the illustrations are admirable, both the author's own drawings and the photographs taken for the work by Mr. Cooper Ashton.

The latest developments in the situa-

ulous, criminal in the pursuit of his aim. The Bulgarian has certainly carried things with a high hand in his opposition to the Greek, not only in Macedonia, but in his own territory as well. The struggle will undoubtedly be allowed to go on

METLAKAHITLA GIRLS' ZOBO BAND
From Arctander's "The Apostle of Alaska." Revell.

tion in Turkey already have carried us beyond much of what is dealt with as still in the future in Mr. Allen Upward's *The East End of Europe*,¹ which is, according to its sub-title, the "report of an unofficial mission to the European provinces of Turkey on the eve of the revolution." Mr. Upward will undoubtedly be quite ready to revise his opinion of Abdul Hamid II, who had a knack of favorably impressing the foreigners he received in audience, and wished thus to impress for his own purposes. The latest Armenian massacres he will also have to take into consideration in his judgment of Turkish rule as it has been and is to be, but his book continues to be of value so far as his report on the complicated situation in Macedonia is concerned. Mr. Upward is a Philhellene of almost early nineteenth century hue, however, and for this his readers must make allowance. To him the Bulgarian is the villain of the contest for supremacy there; his methods violent, unscrup-

by the Great Powers, with their conflicting interests. What the new Turkey can do to end an intolerable state of affairs remains still to be seen.

Considering the multitude of books that have been published recently on Japan, another bulky volume should not be added without good reason. No such reason appears in the case of *The Empire of the East*.² Mr. Montgomery shows no superior scholarship or insight into the genius of the people, and he has neither discovered any new sources of information nor been especially diligent in collecting what was known before. His style is dull and his observations commonplace and often repeated. But the book is comprehensive in its scope, moderate in tone and nowhere difficult to understand. It is well illustrated by nineteen prints, mostly Hiroshige's.

Mrs. Conger's *Letters from China*³ is

¹THE EAST END OF EUROPE. A SUNDAY AFTERNOON AT LONDON AS IT WAS IN 1911. BY H. A. MONTGOMERY. CHICAGO: A. C. MCCLURG & CO.

²LETTERS FROM CHINA. BY S. M. P. CONGER. CHICAGO: A. C. MCCLURG & CO. \$2.75.

³THE EAST END OF EUROPE. BY Allen Upward. Illus. New York: E. P. Dutton & Co. 8vo. \$4.00.

a book of much greater value, altho of no more literary art. In this case the *naïveté* and simplicity of the style and thought adds to the value, for it assures us that we have here contemporary observation at first hand, unretouched photographs of historic characters and events. Mrs. Conger's residence in Peking as wife of the American Minister from 1895 to 1904 covered a momentous period in the long history of the Chinese people, the Boxer insurrection and the sudden alteration in the traditional policy toward the Western world resulting from it. When the Empress Dowager came back to Peking after the allied troops had departed she cultivated the friendship of some of the foreign ladies, against whose life she had so recently conspired, and Mrs. Conger, because, as she explains it, of her position as dean of the ladies of the diplomatic corps, and because, as we may add, of her personal qualities, became a welcome visitor in the Forbidden City. We hope that Mrs. Conger will later publish or preserve for posterity fuller details than she has thought proper to give here of her conversations with the Empress Dowager, for she was one of the most mysterious and important of the great women rulers of the world, the greatest of them in some ways, since she governed for forty-seven years the most populous of empires.

A brief excursion into Ireland, to close this survey, *apropos* of William E. Curtis's *One Irish Summer*, of which it will suffice to say that it is crowded with information, and written in the well-known, pleasant style of this experienced traveler, whose "stuff" (to use the vernacular of the newspaper office) is invariably well worth republication in book form.

Summer Books of Work and Play

VACATION, with every other phase of existence, has come to have its literature. Not only do the publishers provide for the summer reader the breeziest, fluffiest of fiction—hammock literature, aptly so called—but they also provide amply for

the more serious-minded. Of the latter class none is more serious nor more voracious than the amateur gardener. That the yearly supply of garden literature almost meets his demand may be seen from the spring army of commuters with its collective nose buried in the season's treatises on some phase of the subject.

Miss Duncan, who has a national reputation as an authority on gardening, has turned this year to the very young person; but her little book¹ is an excellent A B C of gardening for children of an older growth—within its limitations. It avowedly treats only of such simple and hardy growing things as will not

ILLUSTRATION FROM DUNCAN'S "WHEN MOTHER LETS US GARDEN"
McClure, Yard & Co.

easily succumb to the intermittent industry of a child. The stern laws of gardening are epitomized in this fashion:

"Water and soil are the chief of their diet;
Mammy makes it rich; if you haven't this,
buy it."

The text is interspersed with apt verse and charming pen and ink drawings, the latter by Ada Budell. The bush bean has no lesser lights than Browning and Hawthorne for its glorification. The toad has a song to himself, and the watering pot.

A second book on gardening deals with vegetable and small fruit growing for the amateur.² This volume contains, to paraphrase, the practical thoughts of a practical fellow, and is packed with salient advice on planning, planting, pruning and protecting the garden. If the illustrations present the genuine

¹ WHEN MOTHER LETS US GARDEN. By Frances Duncan. New York: McClure, Yard & Co. 78 cts.

² THE VEGETABLE GARDEN. By Ellen E. Burford. Philadelphia: J. B. Lippincott Co. \$1.25.

³ ONE IRISH SUMMER. By William E. Curtis. New York: Dutton & Co. \$1.50.

fruit of the author's experience they prove it worth following. They convince the reviewer, who commends it to the reader who would be a gardener. A gardener's calendar at the end of the book provides occupation for the enthusiast for every month in the year except December, when he must look to his vegetable cellar early and late.

From the garden it is but a step to the devouring insect, and Dr. John B. Smith, New Jersey State Entomologist, has happily considered the subject of *Our Insect Friends and Enemies*³ from this very standpoint—their relationship to all phases of life: to the animal kingdom; to plants as benefactors and as destroyers; to each other; to the animals that feed upon them; to the weather; to man as benefactors and as enemies; to the household, and to the farmer and fruit grower. The pages are crowded with information interesting to the casual reader and specifically valuable to whom it may concern. The author disclaims any attempt at completeness, but does not hesitate to claim accuracy.

On this subject also there is a book for little people called *Little Busybodies*,⁴ but it is built upon the deplorable mistake that the facts of science are dull and uninteresting to the child, and can be successfully administered only in disguise. Moreover, the fiction which serves here as a vehicle is of the poorest. Either as a treatise on certain insects or as a story book it is an insult to a normal child's intelligence or imagination.

More ubiquitous even than the amateur gardener is the poultry raiser, and the return of seed time is scarcely more sure than the appearance of a new authority on this subject. That the author of *American Poultry Culture*⁵ is an enthusiast is evident. He maintains that "ponds, shrubbery, orchards, are but still life etchings until poultry are introduced," and adjures the reader, for esthetic reasons, to have colony houses scattered thruout the orchard. "Consider these," he says, meaning turkeys, pheasants, peacocks, hens, etc., "as you would wide porches or any other feature which

will add to the livableness of your home." The critic demurs that hens are not to be considered either architecturally or esthetically, but, in justice, admits that, in spite of these diverting views, and the author's belief that women are not strong enough to keep more than a hundred hens, the book is a brief, comprehensive and valuable introduction to practical poultry raising.

All of the foregoing subjects are considered in some sort in *The Earth's Bounty*,⁶ by the author of "A Self-Supporting Home." Mrs. St. Maur's books in this field are unexcelled. Every line of the present volume is instinct with the personality of a practical and devoted farmer, while the book has the charm of a vigorous imagination and forceful mind. The photographic illustrations are exceptionally good—many of them very beautiful.

If a woman is not strong enough to practise poultry raising she should be, and some phases of physical development for women are discussed by the director of the Women's Department of Physical Education in the University of Chicago, in collaboration with Frances A. Kellor.⁷ The point at issue is, however, the educational value to the unit as a part of the whole rather than the physical benefit to the individual, and the subject is exploited with the mastery to be expected from such high authority.

No collection of summer books would be complete without a guide to camping. The one under consideration⁸ goes directly to the point, and proves its author's sense of the fitness of things by devoting more than half of his pages to camp cooking, and starting his readers off with the hope "that every one who takes this little book into camp may enjoy himself to the limit."

Dr. Walton adds another to the attempts that have been made to teach the summer resident or visitor uninstructed in botany how to find the name of an unknown flower under the classification of color.⁹ The characteristic of the present volume is that as much science as

³OUR INSECT FRIENDS AND ENEMIES. By John B. Smith, Sc.D. Philadelphia: J. B. Lippincott Co. \$1.50.

⁴LITTLE BUSYBODIES. By Jeannette Marks and Irma Moody. New York: Harper Brothers. 75 cents.

⁵AMERICAN POULTRY CULTURE. By R. B. Sando. New York: The Outing Publishing Co. \$1.75.

⁶THE EARTH'S BOUNTY. By Mrs. E. St. Maur. New York: Macmillan Co. \$2.00.

⁷ATHLETIC GAMES FOR THE EDUCATION OF WOMEN. By Frances A. Kellor and Frances M. Kellor. New York: Henry Holt & Co. \$2.00.

⁸CAMPING AND CAMP COOKING. By Frank A. Walton. Boston: The Ball Publishing Co. 75 cents.

⁹THE COLOR OF FLOWERS. By Dr. Frank A. Walton. Boston: The Ball Publishing Co. 75 cents.

can be hoped for is added, and even an analytical table under each color, with references to sections. To one who knows how to use a botanical manual the book is superfluous and he would be startled to find a buttercup, a sorrel and a clover in the same section and page; but for the uninstructed layman the color scheme may be as useful as the artificial classification by the counting of stamens and pistils which our grandmothers learned in Mrs. Lincoln's "Botany." As many flowers, and fruits also, are included and briefly described as the amateur is likely to discover, and a goodly number of outline drawings are added, and a dozen flowers are colored in two plates.

Handbook of Alaska: Its Resources, Products and Attractions. By Major-General A. W. Greely. New York: Chas. Scribner's Sons. \$2.00.

The Apostle of Alaska. By John W. Arcander. New York: Fleming H. Revell Co. \$1.50.

Of high-flown eulogy and lurid romance about Alaska we had enough, and General Greely's *Handbook* is useful in bringing us down to solid earth and giving plain facts and figures. He discusses the resources of the country, its mines, agriculture, forests and fisheries; its climate and scenery; its native and American population, and its needs and possibilities. It is to be hoped that the Exposition now about to open in Seattle will interest the American people in the rich territory which they purchased with such misgivings and neglected so long. For the last five years the products of Alaska annually exceeded \$30,000,000 in value, and its importations \$17,000,000, amount to nearly double those of the Philippines. General Greely refers briefly to the work of the American missionary, William Duncan, who, entering alone a warlike and cannibalistic tribe of Indians, converted them and made of them a moral and industrious community at Metlakatla. The story of this miracle of our own times is told in detail by John W. Arcander, a Minneapolis lawyer, in *The Apostle of Alaska*.

The Summer Garden of Pleasure. By Mrs. Stephen Batson. With 36 illustrations in color by Osman Pittman. 12mo., pp. xiv, 222. Chicago: A. C. McClurg & Co. \$3.50.

We have here an attractive volume, with its colored plates from English gardens. The opening pages will fascinate one who is interested in the wild garden, altho the fact that the book has England rather than America in view will suggest to the reader plants not mentioned by the author. Yet we learn that in England our mayflower, *Epigæa*, can be cultivated, difficult as we find it to make it live in cultivation here. We read:

"It must be sheltered from the north wind, and should be pegged down to enable its shoots to root from the joints. In spring a top dressing of leaf mold must be worked in among the stems; and if this attention is not paid it the plant will not survive many seasons."

But the special value of this instructive volume is that it follows the seasons, suggesting flowers for each of the months of the flowering season. There are special chapters for primroses, irises, peonies, larkspurs, lilies, etc., and a multitude of the choicest flowers of many names described and characterized. It is well worth its place in the flower-lover's library.

A Summer in Touraine. The Record of a Sojourn Among the Chateaux of the Loire. By Frederic Lees. Chicago: A. C. McClurg & Co. \$2.75.

This is one of that numerous and useful class of books that stand intermediate between the condensed guide book and the extensive works on architecture and history. It supplies the information which the tourist needs on the spot in order to construct for himself the background of the past necessary as a setting for the castles and cathedrals of the Old World. Now that the automobile has made touring at once more leisurely and more swift than formerly, such books are especially convenient. This volume is one of the best of its class, adequate, sane and helpful. It is enlivened by an individual touch, descriptive of the author's own wanderings, but nothing of that ridiculous obtrusion of petty adventures and personal jests about the touring party which often mars travel books.

There are nearly a hundred half-tone illustrations, exceptionally well printed, and a dozen color plates, hardly so attractive.

Greek Architecture. By Allan Marquand. Professor of Art and Archæology in Princeton University. New York: The Macmillan Company. Pp. 425, 391 Illustrations. \$2.25.

Professor Marquand has taken his time to bring forth ripened fruit. The long needed book on Greek architecture is now before us. First principles, which some might slightly regard, are now thoroly dealt with. The various kinds of wood and their usefulness are past in review, from the humble alder to the lordly oak. "The wooden doors of the old temple of Artemis lasted, according to Theophrastos, four hundred years." Bricks made of clay mixed with straw and exposed to the sun were practically imperishable. The old temple of Hera, at Olympia, had tree trunks for columns. As soon as they decayed, columns of poros were substituted. The walls above a stone foundation were made of sun-dried brick. "The inhabitants of Utica are said to have exposed bricks to the sun for five years before using them for building purposes." We are informed that the huge acroterion that crowned the gable of the Heræon at Olympia had a hole in the middle, apparently to allow the great disk to contract in the baking. In matters small and great we here see everywhere the practical architect. He dwells on his materials with just discrimination. Even in Athens, where marble was so near, the Old Temple of Athena, on the Akropolis, was built mostly of local limestone, while the islanders were using Parian marble. The discussion of marbles is full of interest. Walls of various structure are described as Cyclopean, polygonal and quadrangular. Styles of bases, columns and capitals show infinite varieties, and here the author shows excellent taste. The great temples are in his sphere. The temple of Zeus, at Akragas, had gigantic capitals pieced together. The temples of Sicily in general show a great freedom in the number of steps. The canon of three steps is here absolutely abolished. The temple of Stratos, in Akarnania, has four steps. In the Theseion we find but

two marble steps, resting, however, on a layer of poros. In Sicily there is no rule as to the number of steps. The architect dwells in beauty of form. He can, of course, appreciate the symmetry of structure and especially the beauty of curves, and one need not try to belittle them. But when he comes to sculpture, and the human figure appears on the scene, our enthusiasm rises. Very few of these are here put in use, but we have a metope of Theseus hunting a deer, and a quadriga from the treasury of the Knidians, and a pair of karyatids from the same building. From the notable buildings of Greek architecture we may select the altar of Pergamon, long called by the early Christians Satan's seat, and now widely known from its reliefs. The lot has fallen to Americans to excavate the theaters at Eretria, Thorikos, Sikyon and Korinth. All of these present some remarkable deviation from the norm. Eretria had a dark passage thru which ghosts could appear in the center of the orchestra.

Pebbles

TO THE SUFFRAGETS: Is a woman who puts her head in a waste basket qualified to vote?—*New York Tribune*.

SHE—What do you think of Mabel?

"ROSES have thorns," they used to say
(A proverb very pat),

But now: "Beneath each marcel wave
There lives a water rat."

—*Herald Lampoon*

BATHING dresses, we are told, are now being made from blotting paper. The advantage of such costumes consists, we understand, in the fact that, as soon as you get out of your depth, the blotting paper sucks up the water.—*Punch*.

PLAIN 2 B SEEN.

"Y R U so C D in your dress?"

Asked the lady of the tramp.

"Decided I must drink a N S."

Replied the unwashed scamp."

—*Laurel*.

THE managing editor wheeled his chair around and pushed a button in the wall. The person wanted entered. "Here," said the editor, "are a number of directions from outsiders as to the best way to run a newspaper. See that they are all carried out."

And the editor, bow gathering them all into a large waste basket, did so.—*The Oceanic*.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street New York

A WEEKLY MAGAZINE. FOUNDED IN 1848

One Year, \$2.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the United States Post Office, \$1.75 a year extra, to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us postpaid in good condition and \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

A Change in Price

ON January 1st, 1910, the subscription price of THE INDEPENDENT will be restored to its former rate of \$3 a year. In 1898 the price was reduced to \$2, but on account of the general increase in all materials, it is necessary to revert to our former rate. For many years THE INDEPENDENT has been the only weekly magazine of its class with a two-dollar subscription rate, which means furnishing the weekly editions to subscribers for less than four cents a copy. Most of our weekly contemporaries are three-dollar a year publications, some are four dollars, and one charges five dollars and twenty cents. It is our desire to prevent the weight of this increased price from falling too heavily on our present subscribers. We do not wish to lose a single subscriber who feels he cannot afford to pay the increase. For this reason we shall accept subscriptions at the old rate during 1909, for as many years in advance as the subscriber desires to pay. The last ten years have seen a steady increase in the position, influence and circulation of THE INDEPENDENT. We realize how largely this is due to our loyal friends, who have always been glad

to say a good word for us and to help us. THE INDEPENDENT is not published merely to amuse. It takes a positive stand on the questions of the day, and we cannot expect to have all our subscribers agree with us at all times. We merely hope that our policy and aims have your approval, and that you will give us the same loyal support in the future that you have in the past.

Picking the Pictures

THIS is how it was done. The *sanctum sanctorum* of THE INDEPENDENT is the largest of all the editorial rooms. Only visitors of unusual penetration reach it; all others are stopped in some one of the five offices leading to it. It is ordinarily empty, being reserved for the weekly conference, when the editors, with a solemnity due to their thorough realization of the responsibility and importance of their positions, meet to decide where they shall insert the lever by which they move the world. From the walls of the room sixty years look down upon them. They are covered with portraits of former editors and distinguished contributors, maps and illustrations of special numbers, frames of autographs and big pictures that used to be used as premiums. When one of the younger members of the staff is about to propose some rash policy he catches a glance from one of his revered predecessors on the wall that makes him hesitate and reconsider. Then when the conference grows dull, as at times it does, one may look at the steel engraving of Lincoln and his Cabinet or the group of American authors and authoresses—they had authoresses in those days—and may speculate on how many new subscribers THE INDEPENDENT would gain in 1910 if it offered a 24 x 36 inch picture of Taft and his Cabinet, or of Robert W. Chambers, Thomas Lawson and Winston Churchill seated at a table conversing with Mrs. Wharton and Miss Frances Little while their distinguished contemporaries stand around them, and Shakespeare, Dante and Goethe look on from above.

But what we were about to say when we ran off into reminiscence was that this room, with whose solemnity and im-

portance we hope the reader is now sufficiently impressed, was a month ago the scene of great excitement and confusion. The long oak table, about which so many weighty questions—but we were not going into that any more—was covered with photographs, all taken out of their envelopes and marked upon the back, so that a reasonable proportion might get safely back to their senders, and thoroly shuffled according to Hoyle, so that the judges could not tell photographer, parents or locality. It was like inspecting an orphan asylum.

Three of the editors were working over the photographs, not to mention various unofficial and voluntary advisers who came in to see them. For all pictures of children are attractive, whether the children themselves are likable or not, and here were all kinds, laughing and crying, demure and mischievous, at work and at play, in all sorts of attitudes and either end up, of all ages from less than one to over seventy.

It was a hard job to reduce the number to sixteen pages full. First, all of the ineligible were thrown out, the children who were too obviously aware of the fact that they were having their pictures taken, and the photographs that were too flat, fuzzy or foggy to be reproduced in half tone. Then they were sorted according to subjects to insure a variety, and the best ones picked out over and over again, a continually diminishing pile, altho sometimes an insistent judge would surreptitiously reinsert into the pile a picture which his colleagues had rejected, contrary to his protestations. It was curious how attached we got to particular children and how badly we felt when they had to be sent home. Then, after the set had finally been decided upon, it was found, on turning over the photographs, that we had unwittingly selected several pictures by the same photographer. But there was no help for that, for we had agreed not to consider the photographer. Perhaps next year we shall limit the number accepted from any one person.

But the important thing—how well the task of selecting was done—must be left for our readers. We are confident that they will approve of our choice—because they did not see those we rejected.

Compromise by Submission

It was in a suit for divorce in Pennsylvania years ago that the husband gave testimony as follows: "We quarreled about sheets. She wanted linen sheets and I wanted cotton; and we compromised on cotton." Such is the compromise which the arbitrators present to the Georgia Railroad at the demand of the white firemen. The number of negro firemen is to be reduced till it does not exceed 25 per cent. The first place is always to be given to a white man, no matter which is the more faithful and efficient. The white man shall always be the senior and be preferred in assigning a job.

We are not inclined to blame the United States Government severely for its slowness in the matter. It takes some time to get ready to act, and the Georgia authorities avoided the difficulty by sending out mail trains with no passengers. We must presume that if the mails had still been stopped, President Taft would have acted as vigorously as did President Cleveland in the Chicago strike. That was understood and expected. But we cannot exculpate Governor Hoke Smith. He utterly refused to protect the Georgia Railroad and thus forced the submission. He got his election on the cry of danger of negro supremacy, and had to carry out his infamous policy of injustice.

Possibly the wrong of this settlement is the escape from a greater and more extensive wrong. Negroes have been employed from the beginning as firemen, but without the privilege of promotion as engineers. It is a laborer's job, requiring simple, faithful manual labor. Now the white men want it all, and were this demand made the basis of a contract, it is likely that the trouble would spread to all the railroads in the South.

We have been told that the South is the paradise of the negro; that there the people welcome the negro to all sorts of labor, as mechanics as well as scavengers and porters. But here was the attempt to forbid just this ordinary humble sort of service. It represents the ill will to the aspirations of the negro felt by the lower class of white men. The trouble has been fomented among the country

poor whites along the lines of the railroad. It is they that have dragged the black firemen off the engines and beaten them. They would drive the negro back to the soil.

Well, let them try it. Even their success would be the greater failure. Those that own the soil in the end own the country. If the whites go to the cities and the blacks to the country, in the end the latter will get the better of it. It is the whites that are crowded out of the country, and in the end the successful and wealthier blacks will go to the cities also. The great black belts will have their mechanics, their merchants, their bankers, their men of property and culture, and they will find their level, no matter how high. We have had this week an important conference in this city at which Professor Wilder, of Cornell, and other anatomists and anthropologists have shown most clearly that there is no skull or brain structure by which we can tell a white man from a negro, and this is the present conclusion of science. Every race has its medium men and its great men, and no class prejudice can permanently shut out a race from its opportunity. But even now, a great hope for the negro in the South is the growing sense of justice among the whites. The general condemnation of the Georgia Railroad strike by the Southern press is a most encouraging symptom of a better public sentiment demanding a fair chance for all men.

Combinations and Tariffs

IN a public address at Cincinnati in September last Mr. Taft said that the rates of the Dingley tariff had become generally excessive because conditions had changed since they were made, twelve years ago. The "index number" of a leading commercial journal—a number ascertained for each month by a careful averaging of the prices of groups of commodities in general use—shows that the increase in the cost of living since the Dingley tariff was enacted has been 37 per cent. This increase has not been due to any one cause, but among the causes—and not the least of them—has been the progressive combination of competition by the growth of

combinations in industries protected by tariff duties. Those who look back over the commercial and industrial record of the last twelve years must realize that the combination movement has been continuous, and that by its effect upon prices it has increased the cost of living. Mr. Taft may have had this in mind when he spoke of the changed conditions.

In many cases, combination of protected manufacturers defeats what was formerly regarded as one purpose of a protective duty (so far as industries already in existence are concerned), namely, to stimulate competition in the protected home market, with a resulting reduction of prices that will eventually permit a reduction of the duty, or the removal of it. For those who combine do not, as a rule, intend to reduce prices, but aim to maintain or increase them under the shelter of the tariff wall. Acquiring the power to increase them safely, they do not resist the temptation to do so. As is well known, prices may be controlled even if the combination does not include all the producers in an industry. Having taken advantage of a tariff rate in this way, the combination, either alone or with its allies, not only strives to preserve the rate, but also, when opportunity offers, seeks to make it higher. And to this work it brings the force of a great aggregation of capital. The effect may be seen occasionally now in the pending revision of the tariff.

Of course, the revisers should have taken into account the abuse of existing rates by combinations. There should have been a careful and honest inquiry to ascertain to what extent prices have been increased by combination. Such an inquiry should have been made in the interest of the people, and the revision in certain schedules should have been shaped by the results of it. But the pending bill exhibits, as a rule, no changes due to considerations or information of this kind. Duties that have been abused by destroyers of competition have been retained. In some instances they have been made higher, simply because the addition has been sought by the beneficiaries of the existing rates.

The revisers have also refused to be moved by the abundant evidence that protected combinations have been selling

their products abroad at prices much lower than those which they have exacted at home from the people who gave them protection. There is no end of this evidence, and much of it is to be found in the admissions of the producers themselves. Surely it should have raised in the minds of the revisers the question whether justice and common decency did not require a reduction of the rates which enable these producers to practice such discrimination.

If there were a competent, permanent tariff commission, its duty would be to ascertain the effect of combination upon the prices of protected goods. Congress could not then avoid the official evidence of the abuse of protection. Having the information which such a commission would furnish, it could not defend itself before the people if it should persist in legislating against their interests and for the benefit of those who have combined to take unjust advantage of their favors.

Schooling in the Public Schools

MR. PATRICK O'SHAUGHNESSEY, describing himself as "property owner," has been writing letters to a New York newspaper with intent to knock "municipal ownership," with one terrific argument, out of the ring of debate. The parochial schools, he says, maintained by the Roman Catholic Church, are conducted for about 25 per cent. of the cost of carrying on the public schools, and give a better secular education. And what is the explanation of so wonderful an achievement. "It is simply a case of municipal ownership," says Mr. O'Shaughnessey. But a skeptic retorts: "The explanation is it you want? Well, then, the explanation is,—they don't!"

Thus do great intellects differ in momentous subjects. We shall not venture to decide whether Mr. O'Shaughnessey or his laconic adversary has the better case. We report their altercation only for the purpose of remarking that no harm could happen to the American people if both the public and the parochial schools imparted a better "schooling" than they offer for the money that they cost.

To tell the plain truth about it, there is something mysterious and disconcerting about the ratio of educational cost and fuss to sifted net intelligence ground out by the American educational machine. At whatever point one observes this machine, it seems to be "going some." It looks and buzzes like a dynamo. Spend a morning in any public school class room, and you go away with the feeling that children, teachers, principals and superintendents are energetic, keen, clever and up-to-date. Attend a convention of teachers, or even of "educators," and you experience all sorts of thrills. Intelligence bubbles like champagne, and "convictions" walk about on their own legs. And yet, when you have occasion to sample the product of all this well-directed and whizzing activity, you are aghast. Inability to converse in accurate sentences; inability to write felicitously; inability to keep the run of geographical relations that are alluded to in the news columns of the daily paper; inability to add and to multiply; ignorance of all history, European and American,—these are the facts that you encounter when you take the "educated boy" into your office or start the college graduate at work upon his dissertation for the doctor's degree.

Do these facts afford us a partial explanation of the disquieting state of affairs which Professor Sumner writes about in his recent magazine article on the persistence of credulity? It is Professor Sumner's belief that a recurrence of the horrible witchcraft delusion is entirely within the range of possibility. Millions of human beings in this land of reputed enlightenment are at this moment less enlightened than the townspeople of Salem were in the last half of the seventeenth century. The results of the nineteenth century, science and scholarship have made not the slightest impression upon their minds. There is no *ism* so vulgar, no "cure" or "therapy" so asinine that they will not run after it in herds. They are mob-minded, needing but slight provocation to pass instant judgment upon any accused wretch, without asking for evidence, and to execute him on the spot by lynch law. What more do we need, by way of essen-

tial ingredients for a new witchcraft delusion, or something else quite as dreadful?

Yet these millions of uninformed half-superstitious, credulous beings, have nearly all of them been "educated!" They have been taught not only "the three Rs," but also history, "civics," "physiology and hygiene," and "ologies" enough to stock a university.

What is wrong? We suspect that the most fundamental thing in our educational methods is wrong. We suspect that after six to ten thousand years, more or less, of alleged progress, 999 school children in every thousand are still permitted, nay, encouraged, to *believe* that an alleged fact is so because the teacher or the text-book *says* that it is so, instead of being required to *show* to the teacher's satisfaction by a simple process of explanation or demonstration that it *is* so, or that it is *not* so, or that, at the present time it is NOT PROVEN.

Not all the new-fangled "methodologies" or systems of "pedagogy" which the mind of the "educator" can conceive of will or can save the American people from ignorance and superstition until we have a radical reform in this fundamental particular.

We should rejoice to see the evidence that one American teacher in fifty today ever awakens in the minds of his pupils the slightest perception of the difference between *believing* a thing and *knowing* it.

Extension of Civil Pensions

GOVERNOR DRAPER, of Massachusetts, signed, on the 24th, the Boston & Maine pension bill, which is a very important step as supplementing the Massachusetts savings bank insurance and pension system, and developing an American system of pensions and working men's insurance. The bill has these important features:

1. The system is co-operative in contributions. The pensions to be provided will be supplied by equal contributions from employer and employees, subject only to the clause that the employer will make up any deficiency so that the minimum annual payment shall be not less than \$200. To meet the hardships inci-

dent to those already advanced in years and service, the company undertakes to make an additional contribution, the amount of which is being left to its discretion. With a view to encouraging a reasonably large old age income, provision is made by which regular pensions may be supplemented by annuities to be purchased by the men voluntarily thru current contributions from income.

2. The system is co-operative in management. The rules governing the system are to be made by the board of trustees in which the railroad and the employees have equal representation.

3. The system is co-operative also in this: That its establishment depends upon its being adopted by vote of both the railroad and the employees, a vote of two-thirds of the employees voting thereon being required for its adoption.

4. The system creates legal rights. A great defect in systems established by railroads and other large corporations has been that they create a body of dependents, and in many instances that doubtless was the main purpose. Under such systems the pension not being a right, proves often to have been delusive, and perhaps more frequently is used to limit the freedom of the worker. Under the Boston & Maine bill the employee acquires a legal right to the pension. If he ceases to be an employee of the company, he loses the pension proper, but he has paid to him an amount equal to at least the amount of his contributions.

5. The "elective obligatory" clause is an entirely new feature in pension legislation. Under this clause the system, when established by the vote of the railroad and of the employees, becomes obligatory upon all persons thereafter entering the employ of the railroad, and upon all persons in the employ of the railroad at the time the system was established, except such persons who both voted against the adoption of the system, and recorded within three months thereafter their objections thereto. By virtue of this provision it is expected that the system will become operative, upon its establishment, upon practically all the 27,000 employees of the system, and that thereafter the contributions to the fund will become practically automatic thru the deductions from wages. By this means are

secured obligatory contributions by democratic methods.

6. The pension funds are exempt from taxation, and the right to the pension is made an inalienable right. It involves prohibition of loss of the bare means of subsistence either thru legal processes or voluntary act, just as much as loss of liberty thru selling oneself into servitude.

7. The supervision of the pension system is placed under the same State supervision as applies to ordinary insurance or savings bank insurance and pension system. In the case of this railroad provision is made under Government supervision for a separate savings institution, carefully guarded even to the point of having both the Insurance Commissioner and the State Actuary join in supervision with a view to securing the greatest possible safety.

This bill was enacted upon petition of the employees of the railroad, but had thruout the sympathetic co-operation of the railroad officials, which was rather an extraordinary example of enlightened action on the part of a great corporation.

This act is an important step, for we believe Massachusetts will follow it with an extension of the co-operative system to cover accident insurance and invalidity insurance, and will develop out of this bill a general law under which other public service and private corporations may put into operation a co-operative old age pension system.

Loisy's Opening Lecture

ON the first Monday of May, the new professor of the history of religions faced an audience which filled the largest hall of the College de France. Its administrator, or president as we would say, Lavasseur, aged eighty years, with some seventeen or eighteen professors—about one-half the staff—accompanied the ex-priest to the rostrum and sat behind him. The applause of the three hundred and more present, which lasted several minutes, was enthusiastic and sincere.

Dressed as a layman with a full gray beard, Loisy began in a modest voice, which became stronger as he went on. Always a slow, decisive speaker, he was

very impressive as he read the already printed lecture. In opening up he ignored his own past; not a word about himself or his trials. He paid warm eulogies to Albert Reville, who founded the chair in 1880 and was its first occupant, as also to his son, Jean, its second holder. His words were more than eulogistic, for Loisy gave a résumé of their writings. He first compared the elder Reville's "Jesus of Nazareth" with Renan's "Life of Jesus; and next he past to the writings of Jean Reville, laying stress upon "Religion in Rome Under Severus" and "The Origins of the Episcopate." In the latter work Jean Reville faced the problem of how Christianity developed during the first centuries, and Loisy quoted Reville's own words:

"The analysis and synthesis of all the religious factors, which in the Roman Empire led up to the forming of the religious mentality and body of doctrine and institutions whence our Western world drew its nourishment up to the dawn of science in modern times; primitive Semitic religions, Egyptian, Assyro-Chaldaic, Israel's religion, Judaism, Mazdeism, Greek, Greek religious philosophy, Syrian and Phrygian, Gnosticism, evolutionary and dual—all helped to religious syncretism in the Roman Empire and in rebounding to the formation of the Christian religion in the Roman Empire."

Loisy also made his own a declaration of Jean Reville's, that it is in the human soul that we must seek the ultimate and sound explanation of religious phenomena; in the imagination; in the heart; in reason; in conscience; in instinct; in the passions.

Coming to his own course Loisy declared that he was not appointed to continue much less to surpass the courses of his predecessors, but that he would follow his own personal program, more or less different from theirs. He would try to render justice to humanity, which for ages upon ages had put its chief interest in religion, which he could not look upon as a chimera. Nor would he pick out the faults of the various religions nor regard them as a succession of absurd and incoherent dreams. The study of comparative mythologies can be at best only a phase in the history of religions. This phase he will not pass by but he hopes to probe deeper.

"Mythology and theology are rather products of religion than religion itself."

Turning next to the results achieved

by anthropology and the study of folklore, Loisy considered totemism as a call to further study of the cults of antiquity. Next he paid his respects to the young French School of Sociology, whose leader, Durkheim, holds that God is society idealized. Loisy agreed as to the need of studying the social side of religious phenomena, but insisted that the individual must not be overlooked. The individual acts upon society, which in its turn reacts upon him. He warned this young school against the danger of creating a scholasticism of religion rather than its science.

"The elements of religion are not very many. They are found for the most part in the various religious cults. Their forms, diverse and successive, are, strictly speaking, the matter of the history of religions. To grasp their sources, their growth, their mutual bond is the work of the historian."

Loisy's closing words are priceless:

"We have no other aim but that of Truth."

A long round of applause followed. The attention of the audience, among whom were about thirty women, was remarkable, when we recall that they sat on backless, narrow benches in no wise comfortable. Outside before and after the lecture crowds gathered. Many of them too late to secure admission, more friends, others foes, others again curious folk. The police kept all, even women and priests, on the move. There was no riot; an unfortunate individual in the lecture room cried out in derision, but after a good caning he was hustled out. The League of Republican Youth had put up posters calling on students to defend Loisy, while the *Camelots du Roi* and the Union of Catholic Youth had covered the walls with another, declaring that they would not interfere. No doubt the action of the Archbishop of Paris, in forbidding, under pain of sin but without any censure, Catholics from attending the course, tended toward peace. Loisy is now fully launched.

Municipal Control of Bakeries

THE contest between the Chicago Health Department and hundreds of bakeries in that city on the ground that they do not comply with the Bakeshop Ordinance of 1907 brings sharply to the front the need for the stricter supervision

and control of bakeries, and also adds interest to the social experiment of municipal bakeries in Catania, Sicily.

In Chicago, Chief Sanitary Inspector Ball precipitated the fight by serving notice on the bakers that they must close their bakeries or remove them from basements. These were served on some of the largest hotels and restaurants in the downtown district and to bakeries in all parts of the city. Out of 480 listed by the Health Department 300 already have received the notices. It is estimated that half the bakeries in the city will retire from business if the ordinance is rigidly enforced. Health Department officials declare that enforcement of the ordinance requiring clean bakeries will have as far-reaching effects as the one requiring pasteurization of milk, but that even a more bitter fight will be necessary on the part of the city in order to secure its enforcement. Every person in Chicago, from the busy patron of the downtown hotel or café to the modest householder, who purchases an occasional cake from the neighborhood bakery, will be affected by the enforcement of the ordinance. The bakery men maintain that the first effect to be noticed by the public will be an increase in food prices similar to the increase in milk prices which has accompanied the Health Department's enforcement of its clean milk ordinance. This attitude was to have been expected and even if the predicted result follows the people ought to be willing to pay the price.

A dispatch from Catania, Sicily, a town of 150,000, quotes Baron Dr. Felice, the Mayor of the city (a nobleman, Socialist, and member of Parliament, and a pioneer advocate of the public ownership of bakeries), as saying:

"Municipal breadmaking is a success. I began by issuing an order, reducing the price of bread from 37 and 30 centesimi to 32 and 25 centesimi, but that was not a socialist measure, for in Italy it is the mayor's duty to fix a maximum rate for bread, which bakers durst not exceed. However, the bakers raised a rumpus, claiming that I was ruining them, and as at the same time they had some trouble with their men, they decided on locking out their hands and attempting to make the community go hungry. The bosses' ultimatum, 'lockout and hunger,' reached me October 17th at noon, and by 6 o'clock that evening I had 'persuaded' them to rent their plants to the city. At 8 o'clock I had engaged every baker's

assistant, apprentice and breadseller in town, and all were ready to commence work, with the city for boss, when I received word that the bosses had trapped me, or had tried to do so, at least.

"During several weeks preceding the October troubles they had kept their stock of fuel purposely low, while just previous to turning the bakeries over to the city they managed to spirit away every stick of wood on hand. I sent to the yards. They were empty, several unknown capitalists having bought out the entire supply and shipped it out of town. I commanded the plants and men, but had not the wherewithal to work them.

"The situation perplexed me for a moment only. Necessity being the supreme law, I sent out bailiffs to confiscate for public use all wood coming from Etna forests. By 10 o'clock p. m. we had enough to go on with, and on October 18th our citizens ate municipal bread for breakfast."

The city sells the bakers' 37 centesimi loaf for 30 centesimi and the 30 centesimi loaf for 20 centesimi. While under the bakers' rule the smallest bread obtainable cost 5 centesimi, the city sells the same for 2. But perhaps the main advantage from the economic point of view is this: The city allows no sort of adulteration; it sells pure wheat bread only, while the bakers imported 300 tons of maize and chestnut flour every month to mix with the wheat.

Baron Dr. Felice says that the workingmen's question has also been solved. The municipal bakeries, from the start, could get along with fewer hands than the bosses, but the city retained all employed, at monthly wages, at the same time endeavoring to find work elsewhere for those not needed. In this it gradually succeeded. And today he avers all are satisfied—the working bakers, the public, particularly the poor, and last, but not least, the bosses, who enjoy a comfortable income without troubling about the price of raw materials, wages, unionism, etc.

The ninetieth birthday of Julia Ward Howe was celebrated in Boston, May 27th, and she was quite able to take part in the festivities planned by her relatives and friends. Mrs. Howe appears as a lingering and honored representative of a far distant past. It is not simply that she was the author of the "Battle Hymn of the Republic," now al-

most half a century ago, but that her husband took part in the Greek revolution and was the founder more than seventy-five years ago of the Perkins Institution for the Blind, which is now the parent to nearly fifty similar institutions thruout the country. She maintains her intellectual vigor and during the past year has made several public appearances, preaching sermons from the pulpit of the Church of the Disciples, pleading for international peace, in behalf of suffrage for women, and last of all, for the freedom of the Russian serfs. She is the only relic of the period when Boston possessed the title of being the center of American culture and thought itself the Hub of the Universe. Of the older literary circle the one next succeeding her is Colonel Thomas Wentworth Higginson. We sincerely hope that she will live to round out her century and be visited by many who will make pilgrimages to do her honor.

The Governor's Room

After millions for other philanthropic purposes a gift of \$25,000 could not have been more properly applied by Mrs. Russell Sage than that which has restored as nearly as possible the Governor's Room in our beautiful City Hall to its original condition. In the center is Washington's mahogany writing desk. The cornices, door heads, mantels and chandelier are all new, designed after old pictures and drawings. The bogus windows have been cut thru admitting light. The colors and hangings are simple and beautiful, after the early Colonial style. When the National Government was established in New York in the old City Hall, then called Federal Hall, the city spent a large sum rearranging it for the Federal Government; and when the new City Hall was built, most of the furnishings were brought over from Federal Hall. The present reconstruction has been under the supervision of the Art Commission of the City of New York, the president of which is Robert W. DeForest. The ten portraits by Trumbull have been grouped in the central room while the other historical portraits that have been associated with the room hang in the east and west rooms of the suite.

The identification of Trumbull as the artist of some of the ten portraits had been lost, and they had been ascribed to a restorer until the identification of Trumbull as artist was made at the time of the Centennial of the First Congress by a member of THE INDEPENDENT staff.

Not Enough to Take a Collection

What have the nations done in the case of the horrible massacres in Asiatic Turkey? They have shivered, have sent gunboats to the coast, asked permission to land, been refused, and then have—taken up a collection. Is that enough? Certainly it is not. The nations fail to do more simply because of international jealousies. Each fears that another will get an advantage by its presence. It is a pity that we cannot have a central Hague headquarters of the nations from which, in any such sudden emergency, orders could go forth to this or that nation that might be at hand to land a force and stop the disorder. We do not say that this is possible, but something of the sort is desirable. To be sure a sudden and brief outbreak cannot thus be quelled, if it occur in the interior, as in the case of the massacre of Armenians some years ago. But these last massacres were at Adana and thereabouts. Adana is less than fifty miles from the port of Mersina by railroad, and Tarsus is half way between them. It is no more than a day's sailing from the neighboring island of Cyprus, where British vessels of war must be always present, and other naval forces, French and Italian, must be near by. In the present case the Young Turk military force was busy and could do nothing for two weeks, with all its good will. It is a pity that an international executive could not have sent soldiers speedily, and given protection, at least sufficient to relieve the fear of the recurrence of massacres. It is a fine thing now to take a collection when all the killing has been done, and the girls carried off and distributed to the harems as slaves, but present protection, punishment and prevention would seem to be the duty of the nations. We are glad that at last we have a war vessel at Mersina.

A Missionary on Union

The Presbyterian Synod of England chose John Campbell Gibson, D. D., of Swatow, China. There is a lesson at hand in his address:

"We have long lamented our divisions, and now are beginning to be ashamed of them. The churches planted across the seas have been won not by watchwords of division. In the days of the great persecution in China nine years ago, when the Boxers tested the Christians there, they did not test them by the Westminster Confession, nor the Thirty-nine Articles, nor the Twenty-four, nor by the Sermons of Wesley. They chose a more universal and searching test. Drawing a rude cross upon the ground, they called on their prisoners to trample it under foot, offering life and freedom to those who did so, and death to those that refused. In that hour some fell from a scarcely grasped faith, but many thousands could not bring themselves to put a contemptuous foot on the rudest symbol of the holy passion of their Redeemer, and they died unflinching, not as Anglicans, Wesleyans or Presbyterians, but as Christians, members of the one Body, holding the one faith, inspired by the one Spirit, and so they gained the crown of life."

The creeds, said Dr. Gibson, have become symbols of division rather than of union; they no longer express the living mind of the Church; and their length and their analysis consign them to the theologians, so that they are unknown to the members. For unity there must be no claim to a superior position, no attempt at bargaining, recognition of common baptism, and interchange of membership and service.

Haeckel and Anti-Haeckel

The retirement of Prof. Ernst Haeckel, at the age of seventy-five, from his chair of zoölogy in Jena, has been the occasion of a bitter controversy on the scientific merits and demerits of this most pronounced advocate of evolution in Germany and the *alter ego* of Darwin. Dr. A. Brass, a leader in the Kepler Bund, the new organization of scientists in the Fatherland that seek to harmonize scientific research with the teachings of the Scriptures, has made a sharp attack on Haeckel, accusing him of having altered pictures of animals and remains in the interest of his hypothesis. Haeckel finally replied that he had made changes also in the drawings of other savants, but none of any importance. All

Germany has taken sides in the matter. Forty-six leading representatives of natural science, including many professors in the universities, united in a declaration of confidence in the scientific demonstration of evolution as voiced by Haeckel, but acknowledged that they did not entirely approve of his methods and manners. Now a counter declaration has appeared signed by thirty-seven university professors, directors of scientific institutes, etc., in which they declare that Haeckel is perfectly unreliable as a savant and that his methods are false throughout. The controversy has assumed national proportions because Haeckel is also the father of the monistic movement, which has gone to work and is *ex-professo* undertaking to substitute its religious creed for that of Christianity. Monistic religious communions have been established particularly in the larger cities and chiefly with the Social Democrats as adherents. All Germany is now divided into a Haeckel and an anti-Haeckel camp.

The Papers of the Duc d'Aumale

The Duc d'Aumale was the son of Louis Philippe, King of the French from 1830 to 1848. He was the most liberal and least unpopular of the French Bourbons, for he stood by the Tri-Couleur and accepted the principles of 1789 as well as the constitutional revolution of 1830, which made his father King. Altho a Lieutenant-General of the Army of France, he had to go twice into exile along with the other members of his family. In 1897 he died and left all his papers to nine legatees, of whom but four now are alive. They are: MM. George Picot, perpetual secretary of the Academy of Moral and Political Sciences; Dareste, member of the same; Limbourg, counsel at the Court of Appeals, Paris; Laugel, administrator of the Paris-Lyon-Mediterranean Railway. These four gentlemen offered the Aumale papers to the Institute of France, which accepted them subject to stipulated conditions and placed them in the Condé Museum, Chantilly, near Paris. There are not less than 20,000 papers, comprising correspondence of the royal family, correspondence with foreign rulers and princes, general correspondence, notes,

military documents of the Duke, letters and memoirs of his second exile, 1886-1889. The conditions are: The papers will remain sealed for twenty years, dating from April 21st, 1909, when the Institute accepted them. The papers, however, of Queen Marie Amelie, Consort of Louis Philippe, must not be opened for thirty years. No doubt this great mass of documents will throw much light on the story of France during the closing half of the nineteenth century, and future historians will find in them fresh details of the struggles for the Third Republic, of Boulangerism, and of the inner relations of European royalty.

We stated, on what we thought good authority, that the poet Swinburne had many years ago joined the Catholic Church. Certain readers doubted it, and the fact that the biographies do not speak of it, and that he was buried by a Church of England clergyman made the statement questionable. But *The Western Watchman* adds the following which we give with all reserve:

"Because he would not recall from publication his prurient productions he was denied the Sacraments after his conversion; and for that reason he could not receive the last Sacraments at his death, and not being able to obtain Catholic burial he wanted no religious ceremony at his funeral."

A blustering, fighting Senator is a disgrace not only to his own State, but to the country. Senator Bailey's assault on a newspaper correspondent the other day is not his first offense of the sort. He made a similar assault once on Senator Beveridge. His viciousness appeared in the speech he made in Austin, Tex., on the occasion of his re-election, when he vowed persistent enmity to those who had opposed him, and laid it as an obligation on his children. Unfortunately, he cannot be expelled by the Senate, but Texas ought to ask his resignation.

Those of our readers who would like an actual photograph, for framing or permanent preservation, of any of the children's pictures printed in tint in this issue of *THE EXPERIMENT*, can procure them of our Art Department for \$1 each. They will be mounted on card-board, and be 5 by 8 inches in size.

Steel Trade and Securities

THE most striking evidence of improvement continues to be furnished by the iron and steel industry, and it deserves much consideration because this industry is justly regarded as a kind of trade barometer. It is announced that the Carnegie Steel Company has booked more orders (those for rails excepted) in the last three months than in the entire year 1908. The only idle mill at the Homestead works was put in operation last week, and the men were allowed no holiday on Monday. Of the Corporation's blast furnace capacity, $74\frac{1}{2}$ per cent. is now in use, and this is soon to be increased to 80 per cent. The Harriman roads have given to the Baldwin works an order for 105 locomotives. At the Bethlehem Steel Company's plant the departments are running to nearly their full capacity. Orders for structural steel (in the entire industry) during the first five months of 1909 are reported to have exceeded those of any corresponding five months in the past.

In the securities market the effect of all this has been quite noticeable. Last week, the price of United States Steel common advanced 4 points, closing at the top, 64 $\frac{3}{8}$, which is a new high record. Transactions were 456,600 shares, or a little more than one-quarter of what was done in the entire list. There were more moderate advances for the shares of several of the independent steel companies. The record shows, however, that since the latter part of February large additions have been made to the prices of these shares, both common and preferred. Reports of an impending consolidation of five or six of the independent companies have been current, and some thought last week that the incorporation of the Imperial Steel Company, in Delaware, with a capital that can be increased to \$750,000,000, was related to such a project. But two or three of the companies published denials. The high price of United States Steel common was puzzling to the cautious investor. At 64 $\frac{3}{8}$ the stock pays barely 3 per cent., and those who are fa-

miliar with the history and the financial reports of the company are not inclined to expect an increase of dividend in the near future.

....The Cincinnati, Hamilton & Dayton Railroad Company, in Governor Harmon's hands as receiver since 1905, is to be reorganized under a plan which provides for the eventual acquisition of the road by the Baltimore & Ohio.

....Contracts were closed last week for \$500,000 worth of machinery to be used in enlarging the works of the Algoma Steel Company, on the Canadian side at Sault Ste. Marie. Philadelphia and London capital is interested there.

....Plans were made last winter for a consolidation of about sixty fertilizer plants in this country, with the addition of certain interests abroad, but the project is said to have been abandoned last week, owing to the refusal of some of the companies to accept the terms proposed by the bankers whose aid had been sought.

New Home of the Knickerbocker Trust Company

THE Knickerbocker Trust Company moved last week to its new building at the corner of Broadway and Exchange Place. Besides several millions in cash upward of \$500,000,000 in corporate trusts, with records and securities belonging to them, were placed in the Harveyized, nickel-steel vault in the basement of the new building. The steel is $3\frac{1}{2}$ inches thick within a 24-inch wall of concrete. The vault is 31 feet long and 23 feet deep and rests upon a foundation independent of that of the building and strong enough to support the weight of the entire structure of steel and granite above it. The Knickerbocker Trust Company has had a remarkable growth since it was organized in 1884. The capital stock is \$1,200,000, its undivided profits are \$1,384,845, and its total assets \$49,920,907. Its first president was

THE NEW BUILDING OF THE KNICKERBOCKER TRUST COMPANY,
60 Broadway, corner of Exchange place, New York

Frederick C. Eldredge, and other presidents have been John P. Townsend, Robert Maclay and Charles T. Barney. The present officers of the company are Charles H. Keep, president; B. L. Allen, Joseph T. Brown, Frederic C. Walcott and William Turnbull, vice-presidents, and Harris A. Dunn, secretary and treas-

urer. Besides the new building at 60 Broadway, which is called the downtown office, an illustration of which is here with presented, the main office of the company is at 358 Fifth Avenue, at the corner of Thirty-fourth street, and branches are in Harlem and in the Bronx.

INSURANCE

The Vacation and Insurance

At the present time almost every man is thinking about if not actually planning for his annual vacation. He is going to the mountains, to the seashore or he is going here and there by train or motor car. Whatever he does or wherever he goes, he is bound to encounter hazards that differ from those to which he is always subject. Few men think about insurance in connection with their vacation. They ought to do so, but they do not. Accidents generally happen at the very time when they are least expected, exactly as a fire comes just as the insurance policy expires. The vacation season is one of joy, but it is also one of extra hazard, because of bathing, of sailing, of driving, of collision, of dozens of possibilities that while a life or an accident insurance policy does not prevent, it helps in so far as insurance can help.

If a man goes hunting he does not expect to shoot himself, but he might. If a man goes fishing he does not expect to fall overboard and get drowned, but he might. If he goes out riding in an automobile he does not expect to meet death or injury while riding, but he might. Auto cars have turned turtle, they have plunged over a bank with serious if not fatal results, and there is always the chance of their doing it again. No man is safe at home or abroad for a single instant, and when on vacation he will find himself far more care free with insurance than without it. When you go away this summer why not try the experiment of taking out vacation insurance.

Plan for Washington Life Rejected

SUPERINTENDENT of Insurance Hatchkiss last week denied the application of the Pittsburgh Life and Trust Company for admission to do business in the State of New York. This is especially interesting in connection with the Pittsburgh concern's relation to the Washington Life, the stock of which it acquired last September. The Superintendent of Insurance accompanied his adverse decision, however, with a memorandum in

which a new contract of reinsurance is suggested, whereby the assets of the Washington Company are largely to be kept in this State, and the policy-holders of the Washington Life Company will be fully protected.

The Monongahela Insurance Company in New York

ONE of the features of last week in insurance circles was the passing of control of the Monongahela Insurance Company of Pittsburgh. The Monongahela was incorporated in February, 1857, with an authorized capital of \$500,000, of which \$34,000 was paid in. The company has had a successful business career. Stock dividends for the most part exceeding 10 per cent. have been paid by the Monongahela excepting in 1871, 1872 and 1888, when unusually large losses operated to prevent dividend payments. The insurance firm of Whilden & Hancock, of 105 William street, for themselves and other interests, bought 2,100 of the 4,000 shares of the company. It is the intention of the new management to establish an office of the company in this city, to increase the capital from \$200,000 to \$500,000, and to materially expand the company's field of operations.

The story is told of a man who, on being rejected as a risk by one London company, consulted with a local doctor who had a prescription of a wonderful tonic, obtained this prescription, had it compounded by a chemist, and after taking the prescription and while under its stiffening effect he went to another insurance office and was accepted as a risk without demur. There is doubtless always something to be learned in medicine and it may be that the "elixir of life" once vainly sought after by Ponce de Leon in Florida has in these latter days been compounded by the nameless London physician. If so the formula would make interesting reading both for the insurance companies and for risks who want insurance but who cannot pass the current medical examinations. By all means let us have the formula.

The Independent

VOL. LXVI NEW YORK, THURSDAY, JUNE 10, 1909

No. 3158

Survey of the World

**Mr. MacVeagh
on the Administration**

Mr. MacVeagh, Secretary of the Treasury, was one of the guests of honor at the annual banquet of the Chicago Commercial Club, last Saturday night, and the subject of his address was the new Administration and its policies. The Administration, he said, would be "a Taft Administration, as distinguishable from the Roosevelt Administration as Roosevelt's was distinguishable from McKinley's." The leading and controlling note would be a determined tendency toward regularity of decision and procedure:

"It will be conciliatory if you do not ask it to give up a principle or to go back on its promises. Neither of these things will it do." The President would administer his office within constituted boundaries. The effect of this would be to keep him the leader of the party organization:

"But President Taft is a man of progress, and it goes without saying that no great leader of an American party, in this day and generation, can fail to understand the value of independent thought and action in the party itself, wherever they are manifested, whether in Congress or at large, if only this independence aims at the party's progress and liberalization, and if it seeks in and thru the party to answer more perfectly the deliberate and wise demands of the nation. And you and I must agree—for we cannot escape the conclusion—that it might become at any time the duty of any great party leader to create for his party a new majority and control."

He spoke of Mr. Taft's deference to and respect for the formal privileges of the Congress; his "disposition to respect all rights in the hope and interest of a homogeneous party of progress, a disposition which can only be interpreted as statesmanlike conciliation, and which it would be a fatal mistake to regard as a change of actual policy or purpose."

The Roosevelt policies, he continued, were as safe in the hands of this Administration as they had been in those of the preceding one:

"We are not hearing much about them, but that is partly because the President has his own way of arriving at results and because other issues are now associated with them in the activities at Washington—issues that before left to the Roosevelt policies the whole stage."

Currency and banking reform must be wrought out; the deeper reunion of the South with the North would interest the Administration, and the scientific development of taxation would occupy a part of the stage. But it would be a radical error to think that the distinctive Roosevelt policies would receive less attention or devotion than was now needed for their complete and permanent establishment. Mr. MacVeagh predicted that the tariff revision would be such that the people would accept it:

"The main point is to satisfy the people of the Middle West. If they are not satisfied then the tariff question will unfortunately not be out of the way, and we shall not have rest, and we shall not have a clear field for currency reform. What the people expect is what the protectionist Republican party promised in its last year's platform as interpreted by its candidate for the Presidency, and while it is talking against the wind to argue that the revision is not a revision down, it would be equally futile to say that the revision down was promised to be a revision down and not a revision up."

The Senate's Tariff Debate

In the Senate tariff debate last week, the leading subject was the cotton goods schedule. The rates proposed by Mr. Aldrich and his committee were adopted on Saturday, after a memorable discussion. At the beginning of the week Mr. Root failed to prevent the increase of the

on the floor, which was demanded by the California Senators in the interest of their State. The vote was 43 to 28, eight Republicans voting in the negative and two Democrats with the majority. On Tuesday the battle over the cotton goods duties began, Mr. Dolliver attacking Mr. Aldrich and the committee sharply. On the 2d no action was taken, and provision for night sessions was made. Mr. Gore, the blind Senator, made a wonderful exhibition of the power of his memory, presenting masses of figures from official reports, and quoting from many documents in his criticism of the New England cotton goods manufacturing companies. On that day Mr. La Follette began what proved to be one of the most remarkable speeches of the session, dealing with the subject of revision generally, criticising the committee, and specifically attacking the cotton goods rates. Mr. Elkins spoke briefly for the protection of the coal and petroleum of West Virginia. Mr. La Follette continued in the afternoon of the 3d, but became exhausted. When Mr. Dolliver explained, that evening, that Mr. La Follette was unable to go on at that time, Mr. Penrose, of Pennsylvania, questioned Mr. La Follette's good faith, saying that he made a pretense of being ill, while he was "on the streets consulting the editors of yellow journals and the agents of uplift magazines." Men in their ordinary senses, he added, must refuse to believe any statement about Mr. La Follette's illness. On the following day Mr. La Follette spoke for five hours and a half, and at the beginning explained that he had not been ill, but was exhausted, adding that no one could publicly account for the way in which Mr. Penrose spent his time "when absent from this body," without transgressing the rules of the Senate. The Wisconsin Senator finished that afternoon his elaborate critical analysis of the pending schedule. Mr. Aldrich replied briefly. On Saturday Mr. Dolliver spoke three hours more, and then the votes were taken. On the first of the test motions Mr. Aldrich was victorious, 41 to 30. Ten insurgent Republicans voted against him, and the two Louisiana Democrats were on his side. On the motion opposing the substitution of specific for ad valorem duties (this change involving in-

creases), the vote was 39 to 28 in the committee's favor, and all the other motions were decided by about the same majority. Mr. Aldrich asserted that many of the Dingley rates had been almost nullified or greatly reduced by court rulings. When this point was reached Mr. Tillman said he was tired of "the sham battle." He was satisfied that the committee's bill was full of iniquity and that the victorious majority was "the worst band of buccaneers" he had ever seen. During the week there were many exchanges of sharp personal remarks between the insurgent Republicans and the defenders of the committee.—At the request of our State Department, the German Government prepared and sent to Washington a statement concerning wages in Germany. This was forwarded to the committee, which did not give it to the Senate. In the debate Mr. Aldrich characterized the action of Germany, or of the German manufacturers who supplied the figures, as an impertinence. For this he was denounced by Mr. Stone. Mr. Aldrich did not withdraw the offensive term, but he eulogized the Kaiser. Upon Mr. La Follette's motion the statement has now been procured from the State Department and printed.—The votes upon motions made by the insurgents indicate, of course, that the bill, in the form desired by the committee, will be passed by a safe majority.

Labor Controversies

The strike of street railway employees in Philadelphia, which had been marked by much disorder and violence, was called off at a late hour on the night of the 4th, a settlement having been reached, owing to the intervention of State Senator James P. McNichol, leader of the local Republican organization. Much property had been destroyed, more than a hundred persons had been seriously injured, the police were unable to preserve order, and there was at hand a primary election. It was feared that because of the strike the nomination of District Attorney Rotan for re-election might be prevented. The men are to be reinstated and to have a wage increase of 1 cent an hour. The old pay was 21 cents; the company had offered 22, and

the strikers demanded 25. There is to be a further increase one year hence, if the company's financial condition (as shown by an investigation which the City Comptroller is to make) shall warrant it. The company makes a concession in respect to hours, and agrees to consider grievances with committees representing the men. During the last three days of the strike many cars were burned or wrecked, one non-union motorman was so injured by a mob that he died of his wounds, others were dragged from cars and brutally beaten, and at night there were riots in which the police were successfully defied. The local newspapers say that the strikers themselves did not break the peace.—In Pittsfield, Mass., the street railway company yielded to strikers last week, granting an increase of wages and a straight ten-hour day.—About two-thirds of the Baltimore & Ohio Railroad's machinists are on strike against an extension of the piece-work system. Their places have been filled.—A street railway strike at Evansville, Ind., had some support from a popular boycott until, at the end of last week, a committee representing the local commercial organizations reported that it was not justifiable. The men are returning to work.—The American Sheet and Tin Plate Company, one of the Steel Corporation's subsidiaries, gives notice of an open shop in all its mills on and after the 30th inst. It employs about 15,000 men.

The Panama Libel Case

There was a hearing in Indianapolis, last week, in what is known as the Panama Canal libel case. Judge Anderson, of the United States District Court, was asked by the District Attorney to order the removal to Washington, for trial there, of Delavan Smith and Charles R. Williams, owners of the *Indianapolis News*, who were indicted for criminal libel, the persons alleged to have been injured being Mr. Roosevelt, Senator Root, Mr. Taft and others. Their counsel opposed such removal and undertook to prove that the accused were not guilty of such malice as was necessary to sustain a charge of criminal libel. Judge Anderson ruled against the

Government, holding that evidence of express malice must be presented before he could decide concerning an order for removal. Whereupon the Government asked for delay, in order that it might bring certain witnesses, among them Postmaster-General Hitchcock (formerly chairman of the Republican National Committee), Mr. Mack, chairman of the Democratic National Committee, and persons connected with the banking house of J. P. Morgan & Co. Against the protests of the defendants, a continuance to October 11 was granted. In the course of his remarks, Judge Anderson said that William Nelson Cromwell, attorney for the French Panama Canal Company, in refusing to give the Congressional committee the names of the members of the American syndicate which had been formed to "Americanize the Panama Canal property" (a syndicate afterward dissolved), had given the public an opportunity to infer that there was something to be covered up.

Cuba and Porto Rico

In a message to Congress, transmitting the final report of Governor Magoon, President Taft commends the Governor for his "distinguished service," pointing out that his task in Cuba was one that "required on his part the exercise of ability and tact of the highest order." He also says:

"The Army of Cuban Pacification, under Major General Barry, was of the utmost assistance in the preservation of the peace of the island and the maintenance of law and order, without the slightest friction with the inhabitants of the island, altho the army was widely distributed thru the six provinces and came into close contact with the people."

At a fair election, he adds, General Gomez was chosen President, and "he has begun his administration under good auspices."—Secretary Dickinson emphatically denies the report recently published that the troops of our Gulf Department were being held in readiness for shipment to Cuba. It had been given out on the authority of Adjutant General Fridge, of the Mississippi National Guard.—The census recently taken in Cuba shows that the population is 2,048,680, of which 60.72 per cent. are classified as whites and 30.28 per cent. as negroes.—In a

lecture recently delivered for the benefit of a fund to be expended for a monument in memory of those who lost their lives in the "Maine," Rear-Admiral Sigsbee (who was in command at the time of the explosion) argued at some length that the wreck of the battleship ought not to be raised. Two days later, Rear-Admiral Evans, in a published interview, said the wreck, a menace to shipping and an eyesore, should at once be taken up and removed.—Reports from Porto Rico say that Americans are bitterly attacked there by the newspapers and in public meetings. Joaquin E. Barrero, a Spaniard and editor of a weekly paper, has been arrested and held in \$5,000 for trial on the charge that he violated the postal laws by distributing in the mails a copy of his paper containing an obscene caricature of President Taft. Delegates of the Republican party who have returned from Washington say that the President promised to ask Congress to give the islanders United States citizenship; also, that he has offered the governorship to ex-Representative Watson, of Indiana, whose answer will be delayed until September 1st.

Aeronautic Progress

Count Zeppelin's airship, called "Zeppelin II," has far outdistanced all records by flying a distance of 900 miles in thirty-eight hours without once stopping. It started on May 30 from Lake Constance, but owing to a violent storm the attempt had to be given up. He started again the next day, and it was expected that he would fly to Berlin, a distance of nearly 400 miles. He was accompanied by two engineers and a crew of seven men. The wind was favorable from the South, and they reached Nuremberg at 8:30 in the morning, where an immense crowd greeted him, as he was expected, having dropped a message to that effect. He descended from a great altitude and maneuvered over the town, to the great delight of the people. Crowds went out from Berlin to the place where it was thought he would descend to be received by the Emperor, who came to meet him. But he turned backward about 70 miles from Berlin. In making 400 balloons, 110 is a tree, and

was badly damaged. The descent became necessary from the exhaustion of fuel and the utter weariness of the crew. But on the following morning repairs had been made which permitted the airship to rise again and return to its shelter at Friedrichshafen. The fact that it was able to navigate with its aluminum prow staved in and its forward balloonettes torn is taken as a proof of the superiority of the rigid type of dirigible invented by Count Zeppelin to the semi-rigid or non-rigid types preferred by the German military aeronauts. The War Office has recently refused to purchase any Zeppelins in addition to the two already ordered, but an airship of the rival Gross or Parseval models, while easier to dismantle and transport, would have been completely wrecked by such a collision with a tree in a high wind as the Zeppelin II survived. The average speed made during the voyage was 25 miles an hour. The demonstration of the fact that Germany has now a fleet of eight or ten airships which could leave Metz and sail over Paris and London without needing to land or replenish its fuel has increased the apprehension of an invasion felt in France and England. The Aerial League of the British Empire has asked the public for a subscription of \$250,000 to purchase a Zeppelin machine for study and experiment. The Zeppelin Aerial Navigation Company proposes to establish passenger lines next year, the first probably between Lucerne and Düsseldorf, stopping at Cologne, Bonn, Mayence, Frankfort-on-Main, Karlsruhe and Stuttgart. The vessels will carry twenty passengers in addition to the crew of six. From Lucerne to Cologne the fare will be \$100, and for a trip from Lucerne around the summit of the Rigi, \$25. The University of Göttingen has established a chair of aeronautics, and a laboratory with constant air currents is being constructed. Professor Prandtl has begun his lectures in this course which will cover: (1) Aerostatics (equilibrium of the atmosphere, elements of dynamic meteorology, equilibrium of balloons, and vertical motion); (2) aerodynamics (special laws of air currents, equilibrium and stability of balloons, kites, and aeroplanes); (3) resistance of balloon envelopes and propellers; (4) mathematics

in aeronautical theory and practice; (5) existing airships and flying machines; (6) navigation (topography, speed, and wind calculation).—The record for monoplanes has been beaten by Hubert Latham, at Mourmelon-le-Grand, Marne, by a flight of one hour, seven and a half minutes. He has attained a speed of over 50 miles an hour. The Wright and Farman machines are biplanes.—Eighty orders are reported to have been received by the Wright brothers at Dayton, Ohio, for aeroplanes of their construction. They will cost about \$7,500 apiece. Following the example of the Aeronautical Society of Great Britain, which on May 3 awarded its first gold medal to the Wright brothers, the Aero Club of America will give them medals in Washington on June 10. They will, later, at Dayton, receive the medals voted them by Congress at the close of the last session.—The balloon "Massachusetts," starting from Pittsfield, Mass., June 5, rose to the height of 11,000 feet to get above a rainstorm, a record which has been surpassed in the United States only by the "Heart of the Berkshires," which reached an attitude of 12,200 feet last October.—Plans are being made for an airship patrol service for the Atlantic Coast under Major George O. Squier, of the Signal Corps. The stations will be 250 miles apart, the purpose being not repel an aerial fleet, but to discover and watch a foreign navy approaching the coast.

British Land and Labor Legislation

The Finance bill introduced in Parliament by the Chancellor of the Exchequer, Mr. Lloyd-George, is a long and complicated measure, embodying the provisions outlined in the budget speech. A large part of the bill is devoted to the new taxes imposed upon the unearned increment on undeveloped land and on unutilized mineral deposits. Twenty per cent. duty is to be collected upon the increased value of land whenever it is transferred, bequeathed or leased for a longer term than seven years. The increment value is defined as "the amount, if any, by which the site value of the land on the occasion when the increment value duty

becomes due exceeds the original site value of the land." The undeveloped land duty is to be imposed wherever the site value of the land is more than \$250 per acre. Undeveloped land is that which "has not been developed by being built upon, or being used *bona fide* for any business, trade or industry, other than agriculture." Land surrounding a dwelling house not exceeding one acre in extent, and parks, gardens and spaces open to the public are to be exempted from the undeveloped land duty.—Mr. Winston Churchill has outlined in the House of Commons the Government bill for the establishment of labor exchanges. He said facilities for transfer and communication knitted a modern country together as no country had ever been knitted together before. Labor alone had no profit by this closer organization. The method by which labor obtained its market today is the old, demoralizing method of personal solicitation, hawking labor about from place to place, and the giving of a job was regarded as a thing which placed a man under an obligation. Labor exchanges would increase mobility of labor, but not necessarily increase the movement of labor. Labor exchanges would also afford information as to employment which was now very much needed. It would serve to guide to some extent the new generation in the most profitable fields and would greatly assist the process of dovetailing one seasonal trade into another. The system would be made national, and not municipal, as in Germany. The whole country would be divided into ten divisions, with a divisional clearing-house, presided over by a divisional chief, and all co-ordinated with a national clearing-house in London. There would be thirty to forty first-class labor exchanges in towns of 100,000 and upward, forty-five second-class exchanges in towns between 50,000 and 100,000, and about one hundred and fifty minor sub-offices in smaller centers. The expenses are estimated at \$1,000,000 a year until after permanent buildings for offices and waiting rooms had been erected. He hoped the labor exchange would become the industrial center of each town, the labor market, the office where the trade board would hold its meetings, and trades

unions could find rooms at reasonable rent. The labor exchanges would offer facility for washing and clothes mending, and for non-alcoholic refreshment. The control of the system would be exercised by the Board of Trade, but in order to secure absolute impartiality as between capital and labor, a general advisory committee should be established, in which representatives of the workers and of the employers would meet, under the chairmanship of an impartial permanent official. The labor exchange system would enable the Government to distinguish between those who wanted work and could not find it, and those who were idle thru preference or inefficiency. The next step would be the establishment of a system of insurance against non-employment. This would involve contributions from the work people and from the employers, aided by a substantial subvention from the state. The Government intended to begin with a definite group of skilled laborers, those engaged in house building and construction, engineering, machine and tool making, ship and boat building, vehicles, sawyers and general laborers working at those trades. This group includes 2,500,000 adult males, or about one-third the workingmen. In order to secure the benefits of insurance during a period of unemployment, each workingman would pay about sixpence a week.

Australian Defense

The question of offering a Dreadnought to the British navy has caused the overthrow of the Labor Ministry under Mr. Fisher. When New Zealand offered to construct one or two first-class battle-ships for the imperial navy, the Government of Australia did not follow suit because it had its own plan of providing for the defense of Australia by means of a local fleet of smaller vessels, and besides, was not prepared to contribute such a large sum immediately, but the Premiers of two of the Australian States, New South Wales and Victoria, took it upon themselves to offer to construct a Dreadnought. When the Federal Parliament met at Melbourne on May 26, the Cabinet presented its program, of which the chief provisions were as follows:

(1) Efficient local defense by means of a universally trained citizen army and a local squadron of large destroyers;

(2) A contribution to the cost of imperial defense in the form of relieving the Admiralty, within four years, of the responsibility of defending the Australian coast and policing the Western Pacific;

(3) The encouragement of immigration from Britain by means of much more profuse advertising and greater financial aid to deserving immigrants;

(4) Partly to make room for immigrants, and partly to provide funds for defense, a federal progressive land tax;

(5) The nationalization of the iron industry. Arrangements had been made for the construction of three destroyers and the training of the necessary crews, but the Fisher Ministry held that the effective defense of Australia required a vast increase in the population, so it proposed to introduce a measure of progressive taxation on unimproved land values, leading to the subjection of large estates in order to introduce immigration. All individuals and corporations owning real estate valued at more than \$25,000 would be liable to the tax. A fusion of the Opposition parties—protectionists, free traders and anti-socialists—was formed, and a vote of want of confidence in the Ministry was passed by 39 to 30. Alfred Deakin, leader of the fusion party, became Premier and has included in his Cabinet a new department, the Ministry of Public Defense, to which Joseph Cook has been appointed. At the first meeting of the new Cabinet the Premier was authorized to send a cablegram to London offering a Dreadnought or a corresponding addition to the imperial navy. It is not expected that this political combination will be a stable one, because the parties which compose it are opposed to each other on almost all policies except that of the navy, and have only been able to come together by postponing action for several years on other important questions. — Canada proposes to appropriate \$25,000,000 for the construction of a coast defense fleet, including some smaller vessels on the Great Lakes.

The commission sent by our Government to investigate conditions in Liberia has been actively and successfully at work. It has particularly concerned itself with the

frontier difficulties. The commanders of the two cruisers have made a chart of Monrovia Harbor. A dispatch states, we are not certain on what authority, that there is a universal desire for American protection and American capital. We are told that the people want American experts to run their finances, the customs service, the departments of mining and agriculture, education and the army. The desire for this expert guidance is earnest and sincere, and the Government, there is reason to believe, would be willing to surrender absolute control of the revenues. The commissioners left Monrovia May 29, some of them to go down the coast, while another party will visit the Sierra Leone frontier to continue the investigations there. The visitors all are in good health. *The New York Age*, a leading negro paper, has been publishing a series of letters from a correspondent sent to Liberia, whose report of the industrial and educational conditions there is very pessimistic.

Russian Affairs

The Russian Duma has passed a very important bill giving religious freedom to the sect of Old Believers, who have been persecuted for many years. They embrace about 15,000,000 worshipers, and form the largest body of dissenters in Russia. This act puts into effect the principles of religious liberty enunciated in the Czar's manifesto of May 13. It grants the Old Believers the right to preach and proselytize and places them almost on the same footing as the Orthodox Church. The Conservatives and Octobrists opposed the act, but it received a majority of 39. It is hardly expected, however, that the bill will become a law in its present form. Premier Stolypin told the Duma plainly that the bill would be vetoed if the amendments removing all restrictions in regard to change from one faith to another were retained. The Czar, he said, as head of the orthodox Church, could not in any case allow backsliding from orthodox to non-Christian beliefs. While the Church enjoyed full independence in matters of creed and dogma, it was necessary to maintain state control. This attitude of the Premier will increase the feeling against him in the Duma, because many

of the prominent members are Jews and Mohammedans, and were offended by his remarks.—The Czar has by special order reversed the action of the Governor of Cis-Caucasia, who six weeks ago ordered that Jews be denied admission to the health resorts in the Caucasus.—The Council of the Empire, in passing the marine budget, restored the appropriation of \$1,700,000 rejected by the Duma, for beginning the construction of four new battleships of the Dreadnought type. These will be built by English constructors from English material in the Baltic shipyards.—A series of trips and royal visits has been arranged for the Czar. About June 17 the yacht "Standart," with the Czar, Premier Stolypin and Foreign Minister Isvolsky, will meet in Finnish waters the "Hohenzollern," bearing the Kaiser and his advisers. Chancellor von Bülow will, however, not be present, as he has to superintend the debates in the Reichstag on that date. Afterward the Czar will go to Stockholm, and then return to Peterhof, where he will receive a visit from King Frederic of Denmark. On July 7 and 8 he will go to Poltava to assist in the celebration of the two hundredth anniversary of the victory of Peter the Great over Charles XII of Sweden. Later an imperial visit to France, England and probably Italy is contemplated. The interview between Emperor William and Emperor Nicholas may have an important effect on European politics, in restoring the amicable relationship between the two countries which has been disturbed by the Balkan affair.—The Czar has ordered the release from the fortress of St. Peter and St. Paul of Lieutenant-General Stoessel and Rear-Admiral Nebogatof. Both had been condemned to death by court-martial, the former for the surrender of Port Arthur and the latter for the surrender of the fleet at the battle of Tsushima, but the sentence had been reduced to ten years' imprisonment, of which they have served about two.—Cholera has broken out in St. Petersburg and a general epidemic such as occurred last year is feared. Twelve cases were reported on June 5 and nine more on the following day.

The West and Guaranty of Deposits

BY CHARLES MOREAU HARGER

[Our readers are familiar with many of Mr. Harger's articles that have appeared from time to time in THE INDEPENDENT. No one keeps in closer touch with political and social movements in the Middle West than this Kansas editor. As he is also a bank director and therefore in close touch with the banking situation, we commend this article to the people of the East, especially bankers, statesmen and economists.—EDITOR.]

WHEN in February, 1908, Oklahoma adopted a statute compelling its banks to "guarantee" their depositors, by paying assessments to a common fund from which the creditors of failed banks were to be reimbursed, it was looked upon by many as an idiosyncrasy of a new State's law-making. Since then the idea has grown throughout the interior States until it has become the most discussed State legislation. This has come regardless of the opposition of many influential bankers and of a portion of the press; it has been accepted alike by Republican and Democratic commonwealths.

As one politician expressed it last fall: "You can go on the stump and talk tariff, currency or railroads and the audience goes to sleep—but begin on bank guaranty and the people come to you like flies."

Perhaps it was a recognition of this that induced both leading parties in some Western States to pledge in their platforms the enactment of guaranty laws and made it easier to adopt such measures when the Legislatures met.

This is the record of the States of the Middle West that have seriously taken up the new idea:

Oklahoma—A compulsory law assessing all State banks, creating a fund from which the Bank Commissioner on taking charge of the failed institution immediately pays off all depositors, reimbursing the fund from the bank's assets; assessments made to keep the fund to one per cent. of all deposits with special assessments on order of Bank Commissioner.

Kansas—To take effect June 30th, a voluntary law, State banks or national banks adopting the plan by vote of their stockholders to pay one-twentieth of one per cent. per assessment, not more than five assessments annually, into a fund

controlled by the banking department, from which the deficit in case of failure is to be met.

Nebraska—In effect July 2d, compulsory; four semi-annual assessments of one-fourth of one per cent. each are to be levied by the banking board upon the deposits of the banks, and after the accumulation of this fund it shall be maintained by an assessment every six months of one-twentieth of one per cent. If an emergency arises assessments not exceeding one per cent. a year may be made. If this is insufficient to pay losses, depositors in failed banks must await the accumulation of the money necessary to pay them off, receiving a certificate as evidence of claims. Immediate payment is not provided for.

South Dakota—Voluntary, incorporated association formed when one hundred banks with \$1,000,000 capital in aggregate join, charter fee \$1000 and upward, annual premium one mill on each dollar average daily deposits, association under management of banking commissioner, losses paid similar to payment by insurance company.

Colorado—Two compulsory bank guaranty bills were introduced at the late session of the Legislature, one providing for a mutual guaranty fund, limited in amount, to be secured by a limited annual tax upon the deposits of all State banks, with no emergency levy; the other providing for the accumulation of a guaranty or indemnity fund by each bank individually, to amount to ten per cent. of the deposits at the end of ten years, the State Bank Commissioner to direct the investment of such funds in approved securities. The national bankers favored the latter bill. The two houses of the Legislature disagreed, one adopting the mutual guaranty bill and the Senate insisting upon the individual guaranty bill;

both bills were killed by failure to agree upon a conference report. If an extra session of the Legislature be called, the effort to pass one of the bills will be renewed.

Texas—The special session has just passed a compromise measure providing a bond security plan and authorizing a State Guaranty Fund—one arranging for bonds approved by the banking board to guarantee the deposits of the individual bank and to be for twice the amount of the deposits, the other levying assessments until at least \$300,000 has been raised, thereafter to be kept intact to pay losses—both plans voluntary.

Two other States have gone into the matter and will eventually adopt a guaranty law.

These outlines indicate the trend of the movement. It is an effort to work out absolute safety for the depositor on the theory that the bank from the nature of its business owes this assurance.

Out of the discussions of the past two facts are established: The bank guaranty has come to stay for the present; compulsory or voluntary membership amounts to the same thing.

A Nebraska farmer, who brought \$17,000 into Central Kansas to invest in land, went to a bank to deposit it while he "looked around." "You are not guaranteed by the State?" he asked. Told that the law was not yet in effect, he added, "When it goes in, if you don't join, my money comes out. I've had some experience with failed banks and take no chances." That was a typical view. The depositor generally has no interest in the bank's success as a dividend-payer; he demands only that he shall be able to get his money when he wants it. This is particularly true of an agricultural community, for the farmer, unlike the manufacturer and the merchant, is not usually both a borrower and a depositor. The bank is to him a safe deposit box, rather than a carrier of credits. This accounts to some extent for the impetus that the guaranty idea has gained in farming communities, while in manufacturing States and in large cities less attention is given it.

While there has yet been no test of the law in States where it is voluntary with the banks whether or not to take

advantage of the provision, the indications are that practically every bank eligible will enter the "guaranteed" list. The competition in banking is keen and the **advantage given in securing deposits** is a strong incentive to bankers to make application for the benefits. They feel that its prospective cost will be more than returned in the benefits of financial standing in the community and in added confidence on the part of the depositors.

The national bankers are placed in an undesirable position by the workings of the guaranty plan. Tho all the State laws provide that national banks may enter the fund on the same basis as the State institutions, the Comptroller and the United States Attorney-General have **uniformly decided in response to inquiries** from States having the new law that no national bank may pay assessments to meet the obligations of another bank.

The practical operation of the influence in taking deposits from national banks and favoring the State institutions is seen in Oklahoma. Since Oklahoma became a State 344 national banks have been organized within her borders. There are now 257 in actual operation, and since the guaranty State banking law went into effect there has been a net decrease of 58 in the number of national banks. All of the banks which left the national system joined the State guaranty system. The reasons actuating these banks were largely of a local character. For instance, the State Bank Commissioner and the State authorities declined to place State funds or school funds in any bank which did not guarantee its deposits. The rivalry of "guaranteed" banks was, however, the chief impelling cause.

In Kansas the national bankers have formed a deposit insurance company established by bank stockholders, with a capital and surplus deemed sufficient to insure any bank against loss. It works similarly to a bond surety company. This, it is expected, will prove in the public mind as effective as the State guaranty of the rival State banks.

But will it? Actually there is no State guaranty. The laws of all the States adopting the plan specify that no bank shall advertise that it is "guaranteed by the State," but it may in all advertise in

substance that, "This bank's depositors are protected by the Bank Guaranty Fund of the State."

Will the average depositor see any difference? The bankers evidently think not, so eager are they in States where the new statutes are not yet in effect to advertise that they will soon be "guaranteed."

To the national bankers comes the problem: Will they be able to convince the depositor that their insurance or surety idea is as staunch as the State guaranty plan—tho it may in fact be of more substantial financial worth? The magic of the word "State" appeals and they fear its power. If the Federal authorities persist in refusing nationals the privilege of taking advantage of the guaranty funds of the States, it will mean a material loss in the number of national banks and a consequent curtailing of currency issue, entailing, should the movement spread over a considerable portion of the nation, another problem of greater seriousness.

One of the criticisms of the plan is that it means loose banking, the offering of excessive interest to secure deposits and the making of bad loans in handling the funds thus collected. This danger the States just adopting the law have sought to avoid by providing a maximum interest rate on time deposits and that amounts drawing a higher rate shall not be "guaranteed." In Kansas this rate is 3 per cent., and no bank may receive deposits in greater amount than ten times the sum of its capital and surplus; in Nebraska, 4 per cent.; in South Dakota, 5 per cent. Other provisions to protect the States against "wildcat" banking have been incorporated. In Kansas, for instance, the bank commissioner has announced that no new bank shall be started until he is convinced that another bank is needed in the community—which, as some farming countries in the wheat belt now have a bank to every 300 families, is a needed regulation. If this power be exercised wisely it will do much to help the banking business to a surer footing.

Severe comment has been visited upon the plan by the Eastern financial press. It has been called "visionary," "humbug" and other uncomplimentary terms.

To this the West rejoins that the only serious strain on Western banks in the past decade has come by reason of "high finance" in the East. It is proposed, if possible, to protect the West against recurrence of such conditions. It is held that where under usual banking methods each institution looks out for itself regardless of its associates, the mutuality of business interest under the new plan will cause a closer scrutiny and will check downward tendencies before it is too late, for the bankers know a bank's weakness, usually, long before the public is informed. It will work, they say, similarly to the Clearing House in the city.

What the bankers do not like—and this applies to managers of State banks as well as of nationals—is that it puts all banks on the same level as to financial standing.

"What is the use," one banker express it, "of working for years building up a standing in the country for conservative and safe banking, adding to the bank's surplus and gaining large deposits because of the impetus of volume, if suddenly every little bank within twenty miles is to be made exactly as safe as mine—for I must help pay its depositors should failure come?"

This is essentially its greatest injustice—for the expense involved under the limited assessments proposed by the later legislation is not material. It may be, however, that with the public convinced that deposits will not be lost, more than enough money will come out of cellars, bureau drawers and secret hiding places to offset the loss in other directions. In the last analysis, of course, loss of money cannot be prevented absolutely by law; no guaranty short of a heap of gold equal in value to all the deposits is absolute, so that technically the title is a misnomer. But there may be mutuality of interest and the benefit of organization which will prevent many a failure and will materially strengthen the whole banking system even under the worst of financial conditions—and this is quite as likely to result from voluntary organization of bankers as from any State-made compulsion to contribute to a "guaranty" fund.

Primarily bank guaranty has attracted

the West because that section has for ten years been gathering a savings fund from its continued prosperity. The possession of competency has brought the establishment of banks in almost every village and hamlet. Their deposits have grown steadily and their solidity is of direct interest to a larger portion of the population than at any time in the West's history. The farmer pays his bills with checks; he has learned how to use a bank account. This has made it easy for the heralds of the guaranty idea to win followers, and in the Middle West the plan has grown beyond politics and become an economic problem.

Moreover, it is likely to spread farther—if for no other reason than because of the influence on border States of the banks near the line whose attractiveness to depositors is enhanced by their newly acquired appearance of unquestioned solidity.

No test of the guaranty plan has yet been made. Fifteen months of prosperous times is not sufficient to determine

its worth in the day of need. Nor is any prosperous period a test—then it is not needed and if properly administered it will meet all requirements. The trial will come with the first panic conditions. If, then, the confidence in ultimate payment of every depositor prevents "runs" and, what is from the banker's point of view nearly as disastrous, steady drains on deposits, not from need but because of fear, it will, say its advocates, be worth while. As the West is in no immediate danger of conditions even remotely resembling a panic, it should not for a long time have occasion to test its now popular scheme.

One thing is certain: The West takes the bank guaranty seriously and cannot be laughed or sneered out of a thoro trial of its efficacy. It is trying it in enough different forms and with sufficient variation of conditions to settle its position as an adjunct of American banking. After the next "financial flurry" or disastrous panic its place will be definitely fixed.

ARILENE, KANSAS.

Give Me Your Hearts

BY LEWIS WORTHINGTON SMITH

DEAR friends, kind friends, give me your hearts, I pray.

What shall my life be worth, if after death

I shall have walked and sung the lonesome way,

And never made you tremble with my breath?

Lovers of love, this is the worst and last,

That so love in the end is wholly past.

Dear friends, kind friends, give me your eyes a space.

What shall the world be worth, if when I die

The joy of life that once was on my face

Has never clung with yours beneath the sky?

Lovers of life, this is the worst and last,

That so life in the end is wholly past.

Dear friends, kind friends, give me your little praise.

What shall my toil be worth to ease my heart

If never once your voices all my days

Meet mine, as in a song part answers part?

Lovers of death, this is the worst and last,

That so life into death is wholly past.

DRAKE UNIVERSITY, DES MOINES, IA

Finance and Politics in Westminster

BY JUSTIN MCCARTHY

MR. LLOYD-GEORGE, the Chancellor of the Exchequer, is still the hero of the hour. Perhaps to describe him as the hero of the hour is not to accomplish a very literal description, for he is assuredly not regarded as a hero by that part of the public which has for its parliamentary representatives the men who occupy the Opposition benches in the House of Commons, nor is he even very much admired by most of the wealthy men who are regarded as belonging to the Liberal party. But he is none the less the hero of the hour in the sense that he is the British statesman now most talked about inside and outside Westminster Palace thruout these islands.

We have actually ceased for the time to say anything about the expected invasion of the Germans by sea or sky, and we are concentrating all our attention on Mr. Lloyd-George and his budget.

In 1893 Sir William Harcourt, then Chancellor of the Exchequer, created in-

deed an immense sensation thruout these countries by that part of his financial scheme which introduced a complete rearrangement of the death duties on an entirely new principle. But even the sensation created by that bold and successful innovation was not nearly so great as that which Mr. Lloyd-George has made a part of our history.

The budget is denounced by the Conservatives in and out of Parliament, and indeed by all who maintain that the rich man and the poor man ought to be made to pay taxes on the same scale; that the rich man ought not to be called on to contribute toward the support of the state any taxation not imposed upon the poor man as well, and that in any case he ought not to be taxed in any proportion different from that regulating the assessment to which the poorest classes of householders are subjected. Mr. Lloyd-George's measure is therefore incessantly denounced by members of certain wealthy classes and by the news-

THE HOUSE OF COMMONS

Showing the members' benches which have just been reported to the public.

papers which represent those classes as a socialistic scheme of taxation.

Now, I quite admit that it might fairly be described as socialistic in the sense which is commonly, or even, I would say, vulgarly given to that epithet, but if its

STEPHEN GWYNN.

leading principles be fairly described as those of socialism, then I think it is quite time that some Chancellor of the Exchequer should introduce a socialistic budget. For the main principle of Mr. Lloyd-George's budget is unquestionably and indeed avowedly to tax the wealthy on a different principle and with a different proportion from the principle and proportion which prevail with regard to the taxation of the hard-working and the poor, and thus to make the difference between capital and labor recognized in the Government's principle of assessment as it is in all the other facts of life.

Naturally, the Labor party in the House of Commons are supporters of Mr. Lloyd-George, but their numbers would not tell for much if the Opposition were able to carry with them a large force of seceders from the ministerial side of the representative chamber.

There is, therefore, great anxiety felt among the supporters of the Government, and everybody is beginning to enter into conjecture and speculation as to what the House of Lords may make up their minds—"what they call their minds," I think I can hear some Radical commentator interposing—as to what course the hereditary chamber ought to take on this most important subject. The House of Lords cannot indeed reconstruct a financial measure which has been carried by the House of Commons,

ARTHUR HENDERSON, M.P.

Leader of the labor party, who is one of Mr. Lloyd-George's boldest opponents.

but the peers have many methods at their disposal for delaying or rejecting the whole measure, and thus giving an opportunity for an appeal to the decision of the constituencies thru the medium of a general election. There is indeed a strong opinion even among many Liberals that Mr. Asquith's Government are well inclined to encounter the crisis by submitting the whole question to the decision of a general election. But it seems to me that the present time, or

the near coming time, would be in many ways a rather dangerous season at which to submit the fortunes of the Ministry to such an ordeal.

The leading principles of the budget are, as I have already explained, very vehemently condemned and denounced by those who represent the inherited or the amassed wealth of the country. Then, on the other hand, the Labor party is not on the whole by any means satisfied with the general legislation of the Liberal Government. The Labor party, of course, are in favor of all that part of the budget which taxes riches on a higher scale than that applied to the wage-earning and peasant population. But, then, the working classes and their representatives are much opposed to the increase of taxation on beer and spirits, and especially to the increase of the impost on tobacco, that one great and harmless luxury of the poor. I confess that I find it somewhat difficult to understand why Mr. Lloyd-George has made up his mind to add to the cost of the poor man's beer and the poor man's tobacco. I find it hard to believe that the mere consumption of beer in these countries has done much harm so far as mere habits of intoxication are concerned, and in that sense I do not think it can fairly be classed with the use of any actual spirituous liquid, such as brandy, or whisky, or rum, or gin.

Then, apart altogether from any of the questions raised by Mr. Lloyd-George's financial policy, it has to be taken into consideration that the attitude of the Government with regard to the Home Rule question seems to have rendered it very probable that the Irish National party may at a critical junction withdraw its support from the present Ministry, and thus create a loss of nearly a hundred votes to the Liberals at a general election. Under all these conditions it would appear as if an appeal to the country against the domination of the House of Lords could hardly find a period less propitious than that which might be expected to come with the close of the present session.

I know well that there are many members of Mr. Asquith's Government who are sincere and devoted advocates of the principle of national self-government for Ireland. Among these are Herbert

Gladstone, Augustine Birrell, Lord Morley of Blackburn, John Burns, Winston Churchill, Lloyd-George, Lewis Harcourt, and many others. But, on the other hand, there are unquestionably some influential members of the administration and even of the Cabinet who, to put it mildly, never professed any enthusiasm for the cause of Home Rule, and are well inclined toward a policy of postponement with regard to the consideration of that great question. One is, therefore, brought to the somewhat embarrassing conclusion that the very reasons which make it seem dangerous for the Government to hasten the final struggle with the House of Lords make it seem also the more probable that the struggle may be undertaken at the earliest parliamentary opportunity.

Two Irish National members of high position in their party, and, indeed, in the House itself, have just made, thru the columns of English periodicals, their powerful protests against the system of taxation which the Imperial Parliament imposes upon Ireland. One of these is Mr. Stephen Gwynn, whose contribution on the subject appears in the *London Daily Mail*, a Conservative journal having the largest circulation of any metropolitan newspaper. The other is Mr. T. M. Kettle, who expresses his views on the same subject and to a like effect in the *Nineteenth Century*, one of our most conspicuous and influential reviews. These articles ought to find students wherever the condition and the claims of Ireland excite any interest, and they cannot but impress any unprejudiced reader, whatever may have been the previous views of that reader on the whole subject. Both Mr. Stephen Gwynn and Mr. Kettle are, like many other members of the Irish National party now and in former days, distinguished as well in literature as in politics. Mr. Gwynn has made for himself a name as a novelist, a poet, a biographer and an essayist. Mr. Kettle, who has come into parliamentary life at a comparatively recent date, has already won for himself a place of distinction as an orator and debater in the House of Commons. He is also winning celebrity for himself in poetry and in prose, and his name frequently appears in some of the most influential London magazines.

The strangers' galleries of the House of Commons are once again thrown open to visitors, and for some nights past each of these galleries has been occupied by a considerable number of spectators. The interest of the House and the public was, however, naturally occupied much more by the opening of the ladies' gallery than by that of the gallery in which only the nominal lords of creation are allowed to have a seat. The conditions of admission to the ladies' gallery are, however, very different, indeed, from those which prevailed before the suffragettes had made themselves a source of intolerable trouble to the members of the House and to the officials of Westminster Palace. Under the new arrangements a member of the House of Commons can only obtain an order for the admission of a woman who is a relative of his own, and even this restricted privilege is further embarrassed by various conditions which make the venturesome member who has obtained a seat for his mother, or his grandmother, or his aunt from the country, or his pretty niece, responsible for her good behavior during the whole of the time while she is permitted to look down upon her relative from the windows of the ladies' gallery.

I do not suppose it is likely that these peculiar restrictions can long be endured by the Commoners. One cannot help mentally picturing the not impossible perplexity of some member of the House who had all too heedlessly procured an order of admission for his aunt from the country. Our member had, of course, always supposed his aunt to be a most respectable and well-behaved personage, but how if she nevertheless took advantage of her opportunity, became suddenly inspired by an ambition to make herself famous as an advocate of woman's rights, and therefore electrified the House by a screamed demand for the emancipation of women. Up to the present, however, nothing of the kind has come to pass, but I cannot believe in the long endurance of the new conditions. Not to speak of any other objections, does it not seem rather unfair upon one of the younger members of the House that while he is allowed to obtain an order of admission for his farthest removed cousin, he should not be al-

lowed to obtain any such order for the charming girl whom he hopes and expects before very long to make his wife?

I have lately received thru the courtesy of its author a very remarkable and indeed in every sense valuable work entitled "The Story of a Border City During the Civil War." The Civil War is, I need hardly tell my American readers, the American Civil War, and the author is the Rev. Galusha Anderson, who was a minister of religion in the city of St. Louis during that memorable struggle. The book has reached me thru its publishers, Messrs. Little, Brown & Co., and I see that the date of its publication is 1908. It was, however, quite a new work for me, and I read it with the deepest interest. The great Civil War in the American States formed a chapter of history in my lifetime which must ever be to me a living memory. My sympathies, I need hardly tell my American readers, were entirely with the cause of the Northern States and with the abolition of slavery, and altho I had never been in the United States before the war, I was well acquainted with all the questions in dispute and with the condition of politics and parties in the great Western republic. My countrymen in general were devoted to the cause of the Northern States, but I had then been for several years a resident in England, where public opinion was more divided on the subject. Those, however, with whom I was most closely associated in London, one of whom was the illustrious John Bright, were entirely on the side of the North. The story of that part of the war which centered in St. Louis is peculiarly significant of many of the conflicting interests which were characteristic elements in the struggle, and it is, I think, very well and fairly told by Mr. Anderson, who, with all his devotion to the anti-slavery cause and to the union of the States, has proved himself to be a generous and high-minded opponent, capable of making due allowance for the errors of those opposed to him in a great controversy. It was a genuine pleasure to me to receive such a volume and to feel assured by its presentation that its author must have regarded me as one in full sympathy with the great cause of the Northern States.

The Firemen's Strike on the Georgia Railroad

BY LOVICK P. WINTER

STRIKES have not been numerous in the South. Here and there, in the mines of Tennessee and Alabama, in the coast cities among the long-shoremen, and among printers in the cities, and occasionally on some of the railroads, this method has been resorted to by operatives for the settlement of their grievances against their employers. The recent strike of the white firemen on the Georgia Railroad, which was declared off at 2 o'clock p. m. on Saturday, the 29th of May, takes its place as the most notable labor upheaval, in some of its effects and accompaniments, that this section has yet experienced. In some respects it may be considered historic; it is, in other respects, prophetic of what will be more frequent in the South in days to come. The strike lasted twelve days, lacking only a few hours, and during five days and nights of that time not a wheel turned on the three hundred miles of the old Georgia Railroad. Even mail trains were not run. When it is remembered that only about seventy-five firemen were involved in the strike, this result was at least surprising, and this surprise is increased when it is understood that the tie-up was not due to any active interference on the part of the striking firemen with the running of trains. As this strike, by reason of the fact that the race issue has been one of its features, has drawn the attention of the whole country, it is worth while to study with impartial and judicial mind the causes leading up to it, and the conditions which gave it some of its peculiar characteristics.

The Georgia Railroad is the oldest railroad in the State, one of the oldest in the South, and one of the earliest long railroads projected in this country. It was chartered in the early thirties of the last century, and active work began on the line during the latter half of that decade. As originally chartered, it was the purpose of the projectors to build the road from Augusta, which is the head of steamboat navigation on the Savannah River, by way of Washington, Lexington and Athens, and thru Rabun Gap into North Carolina and Tennessee, with a view to penetrating the West, and securing an outlet from that fast developing section to the seacoast. Later, when the State of Georgia decided to build a railroad from Chattanooga, Tenn., to some convenient terminal point in the heart of the north-central belt of the State, the original line of the Georgia Railroad was changed, and the latter and the State road—the Western & Atlantic—came together in a joint terminus in what is now the City of Atlanta, in 1846.

The Georgia Railroad has been one of the most conservative and solidly reliable railroads in all the land. It has never been in financial straits, has no serious bonded indebtedness, and its stockholders have rarely failed to receive a good dividend. And its record for safety is unparalleled. In all the three score and ten years of its history only one passenger has ever lost his life who kept his seat. And the only one who has ever died from injuries received on the trains died from an acci-

dent that was so peculiar that it could hardly have been foreseen and prevented.

The policy of the road toward its employees has been commendably liberal. Many men have grown gray in its service, and the writer knows at least one family which—in the person of father, son or nephew—has had one of its name on the payrolls of the company since 1840. A few years ago the oldest conductor in America died in the employ of the road, being retained there many months after he was unable to do duty, because of his long and faithful service to the company. In another case a section foreman died in one of the houses of the company, in which he had lived for thirty-seven years, his family receiving pay up to the day of his death, tho he had been confined to his bed for a number of weeks, and was at the time of his death over seventy years old.

For a number of years now the Georgia Railroad has been operated by lessees, the lease being held at present by the Louisville & Nashville Railroad jointly with the Atlantic Coast Line. The stockholders receive a guaranteed dividend of 11 per cent. The road passes thru one of the best sections of the State, and besides its main line between Atlanta and Augusta, it has branches to Macon, Athens, Washington, Lexington and Monroe, while its connections in Atlanta and Augusta give it an immense haul of thru freight. The manager of the road at present, as for many years past, is Mr. Thomas K. Scott, who is a Southern man.

The recent strike grew out of the fact that the road employs negro as well as white firemen. This is no new fact in the history of the road. Possibly there has hardly been a time when there were not negro firemen on the engines of the Georgia Railroad since it began to run its trains a number of years before the Civil War. Many of these negro firemen have spent long years in the employ of the road. And until recently there has been no open opposition to the employment of these colored firemen, either by the white firemen or the people along the line of the road, and possibly there would have been none for many days to come but for the recent unfor-

tunate outbreak. The issue involved in this strike was not the race issue *per se*, but a matter growing incidentally out of that issue. A few facts will help to a better understanding of this statement and of the questions involved.

The Georgia Railroad does not pay its colored firemen as much as it pays its white firemen, the difference in wages being 30 per cent. in favor of the whites. It has never been the policy or purpose of the management of the road to advance any of its negro firemen to the position of engineer. It is claimed by the white firemen that, for one pretext and another, a number of white firemen have been put off by the road, and that negroes have taken their places. And whenever there have been vacancies in the more desirable runs, such as day trips and the like, negroes who had done longer service for the road were given precedence in filling these places. This last fact was the crux of the firemen's complaints.

Some weeks ago Mr. E. A. Ball, one of the vice-presidents of the Brotherhood of Firemen and Enginemen of America, came to Augusta and took up the matter with Manager T. K. Scott, of the Georgia Railroad. Several demands were made by the firemen, but the one most urgently insisted upon was that negro firemen should not be given precedence over white firemen. Mr. Scott peremptorily refused to accede to any of the demands of the firemen; Mr. Ball ordered the members of the Brotherhood to strike, and this order was carried into effect on the evening of the 17th. Before the strike began, however, some of the leaders of the movement were summarily dismissed by the authorities of the road.

For several days after the strike began, the train service of the road was maintained with some degree of regularity, negroes and non-union white men being substituted for the strikers. But all along the line of road popular feeling was strong, and grew more intense every day. At several points this popular indignation against the negro firemen, and those who had taken the positions of the strikers, led to riotous demonstrations, and to some acts of violence, tho it appears that no one was se-

riously hurt. On Saturday, the 22d, these demonstrations had become so serious that Mr. Burgess, one of the officials of the Brotherhood of Locomotive Engineers, who had come to Atlanta to look into the situation in the interest of his order, deemed it unsafe to continue the service, and gave permission for his members to decline to run until they were guaranteed full protection. This brought matters to a crisis. Every train on the line and the branches stopped, and the old railroad took the longest rest it has taken in these sixty years. But the privations of the people served by the road grew greater day by day. Yet with the growing scarcity of provisions, and this sudden and unwished for isolation from all the rest of the world, came a growing determination on the part of the people that no trains should pass over the road with negro firemen. Governor Hoke Smith had been appealed to by the authorities for armed protection, but the latter recommended that the questions at issue be settled by arbitration, and that six Georgians be selected as judges. The strikers readily agreed to this proposition, but it was declined by Mr. Scott. Mr. Scott claimed that he had appealed to the Interstate Commerce Commission for mediation under the Erdman act, and could not therefore enter into negotiations in the manner suggested by Governor Smith. On the 27th it was agreed that trains carrying mail should be allowed to run, the strikers even offering to serve on these trains, but the authorities of the road refused their services, and placed negro firemen on the engines.

In the meantime Mr. Charles F. Neill, Commissioner of Labor, had come from Washington to Atlanta to look into the strike. On the 20th he was joined by Mr. M. A. Knapp, the chairman of the Interstate Commerce Commission, and on that day, at 2 p. m., the strike was declared off. The questions at issue

were not fully and finally settled, but a working agreement, in which both sides made concessions, was reached, and the question as to the number and standing of negro firemen on the road is to be settled by arbitration. All the old firemen are at work, there is no disorder anywhere, and the State of Georgia draws a breath of real relief that a very serious situation has passed over without more serious complications. Governor Smith has been severely censured by some papers in and out of Georgia for not taking more drastic measures to remedy the trouble along the line of road. But conservative people everywhere know that it is not possible to fight public sentiment with bayonets. It would not be overstating the case to say that a large per cent. of the people of Georgia were in sympathy with the strikers. It was public sentiment, rather than the riotous spirit, which made the strike even partially successful. This statement is not intended as a defense of riotous violence; it is meant simply as a bare statement of facts. Mr. Scott has been severely censured for sending out the mail trains with negro firemen, when popular feeling along the line of road was greatly inflamed; and this was certainly bringing powder and fire dangerously near each other; but, fortunately, this step only served to bring the strike to a more satisfactory finish.

This strike opens a new phase of the negro question in the South. Hitherto the colored man has had unrestricted access to well nigh every mechanical occupation; with the competition that is sure to come with the growth of population and the increase of manufactures and the spreading of labor unions, the negro will find his sphere contracting unless he shows the greatest fitness for the places he may seek to fill. This strike was not sectional. Mr. Ball, who led the firemen, is a Canadian; Mr. Scott is a Southern man.

HOUSTON, GA.

The Women Novelists of Italy

BY SALVATORE CORTESI

ITALIAN women are fast coming to the front in letters as well as in other fields of activity. Every day adds to their ranks, while for years two or three have towered above many of the distinguished members of the other sex. Women seek all branches of literature; there are novelists, journalists, poets and writers on the questions of the day, but those who have had the greatest success are the novelists and poetesses. The women romance writers, while sometimes straying into other fields, have in the main created a certain specialty for themselves, which has given them their fame. Matilde Serao, for instance, while turning her vivid pen with almost equal success to all subjects, has come to be known especially for her studies of women, her admirers calling her the George

Matilde Serao was born in 1856, in Patras, of a Greek mother and Neapolitan father, receiving from the former her love of literature and from the latter her facile pen, but her vibrating, ardent and original style is something quite her own. She is short and stout, and would, by the generality of people, be called plain looking, but her countenance so lights up and her eyes so sparkle when she is interested that I have heard her called handsome. Undoubtedly she is what the Italians call "simpatica," the

MATILDE SERAO.

Sand of Italy, while Grazia Deledda, almost equally celebrated, owes her popularity to studies of Sardinian peasant life.

GRAZIA DELEDDA

word "magnetic" being the nearest translation of an untranslatable term.

Her first literary steps were in journalism, in 1878, when she began to write in various papers of Naples, Rome and Turin, attracting the attention of the whole peninsula, particularly by her Neapolitan studies. Before long she was a leading member of a well-known Roman paper, no longer existing, the *Capitan Fracassa*, the staff of which formed a group of the most brilliant writers of the period, and were the last resort of Bohemians in the journalistic

SARDINIAN COSTUMES.

SARDINIAN GIRLS.

world of Italy. Later she founded the *Corriere di Roma*, which she afterward transferred to Naples, where she started also two daily journals, still flourishing, the *Mattino* and lately the *Giorno*.

But journalism did not altogether satisfy her, and she tried novel writing with brilliant success, bringing out, among many others, as she is a most prolific writer, "Story of a Nun," "Beatrice," "Lovers," "Two Souls." Her book, "After the Pardon," is perhaps her most brilliant novel, minutely portraying, as it does, the workings of the mind of a woman who has betrayed her husband and been forgiven, and how, altho she no longer loves her lover, she returns to him, being unable to endure the generosity and at the same time reserve of her husband. It is a magnificent lesson in morality, and was last winter dramatized in Paris.

Signora Serao married Signor Edoardo Scarfoglio, from whom she is separated. He is also a well-known writer and is editor and proprietor of the *Mattino*, in which his wife has no more interest. This ill-assorted couple met in Rome, where they were both on the staff of the *Capitan Fracassa*, and their

marriage was more the consequence of literary sympathy than real love. The young Scarfoglio who took part in the New York-Paris automobile race is their son. Thus in an atmosphere of domestic infelicity, burdened with several children and poverty and debts, this wonderful woman produced some of her most delicate and touching scenes. In late years her financial condition has improved, while from these experiences she retains her happy touch and deep knowledge of the workings of the human heart, especially the feminine heart.

Grazia Deledda excels in the same field, that of romance, but with a totally different style and environment. She has in her pen all the rough and almost half savage atmosphere of her native beloved island, Sardinia, which, it may be said, she has revealed to the world, foreign as well as Italian.

She comes from Nuoro, the wildest part of the wild island, where she was born in 1873. She also began her career in the newspapers, writing with extreme tenderness and sympathy of the peasants of her island in the *Sardegna* and the *Avvenire di Sardegna* of Sardinia, and the *Ultima Moda* of Rome. She soon

passed to more important productions, turning her attention to novel writing, depicting with startling reality the life, feelings and struggles of the Sardinians, and bringing out the most pathetic and genial of their qualities. No one better than she has given an idea of those modern centaurs, who love their horses better than themselves. The description of a rural fête at Nuoro in her book, "The Road to Evil," is a masterpiece, the races of the daring horsemen making her men readers alive with emotion and women tremble with fear. She has revealed the psychological condition of a population unknown and consequently often misjudged, describing these descendants of Napoleon's best fighters, and the daring

SARDINIAN PEASANT.

sailors, for whom the whole coast of the Mediterranean has no secrets, and, what is scarcely less important, she has rendered popular the Sardinian costumes, which are so picturesque and remarkable, in an age when the leveling action of progress seems destined to destroy the originality and individuality of past times.

Grazia Deledda comes from a humble but at the same time most talented family, her mother, nephews and nieces wearing the native dress, while her two sisters, Giuseppina, who is married, is a distinguished writer, and Nicoletta, unmarried, writes and

paints. Grazia is a small, gentlemanly, sweet-thinking woman, what the world would call dowdy in dress and

GRAZIA DELEDDA'S NIECES AND NEPHEW IN SARDINIAN COSTUMES

plain of feature, with black hair and small hands and feet, a noted housewife and devoted to her family. She is married happily, having no greater admirer of her writings than her husband.

Her first romance was "An Honest Soul," and among the other best known ones are "Justice," "The Old Man of the Mountain," etc. Her "Nostalgia" was translated into English, with

satisfactory results, but the theme was not Sardinian.

The Marchesa Gina Centa Tartarini is perhaps the best example of the energy and enterprise which characterize the New Italian Woman, new in the sense of interesting herself in every development and every manifestation of intelligence and culture, without throwing off her feminine character and the qualities of the true gentlewoman. She was born, and married, into a noble family, at Feltre in the Venetian provinces, but necessity

pushed her into the literary camp; which she also entered thru journalism when, at the death of her husband, she was left

TERESAH.

time, including Carducci and D'Annunzio, it was a financial failure and stopped after three years. Rossana then courageously faced the struggles and anxieties of daily journalism, understanding that she must accomplish in a short time what others had taken years to do. Dressed as a man, she worked as a stoker on the train between Rome and Genoa, to gain practical knowledge of the

emotions and needs of that class; she then followed the naval maneuvers in a torpedo boat, and went into the iron mines at Montevarchi to a depth of about 550 feet.

As the years passed and she gained knowledge on many subjects, her energies and pen became almost entirely dedicated to the prisons and their inmates, especially the women, who have aroused great pity and love in her woman's heart. With their woes in her mind, her latest production has been a drama called "The

House of Punishment" ("Casa di Pena"), the first scene being a tragedy and the rest taking place entirely in the women's prison.

with two children to support without sufficient means.

She began with a monthly literary review called *Cyano de Bergerac*, taking from the heroine of Rostand's play, Rossana, the *nom de plume* under which she is universally known. Altho the *Cyano* had had as godfathers the best literary men of the

GIUSEPPINA MORELLI DELEDDA.

ROSSANA MARCHESA GINA CENTA TARTARINI.

NICOLETTA DELEDDA.

At one time there are forty women prisoners on the stage, and so touching and poignant is the vision of their sufferings that the audience, when it was given in Turin lately, sobbed aloud. The men's prisons of Italy have been brought up to date, but the women's, probably because they have not had before an eloquent advocate, are practically what they were a hundred years ago. The Duke of the Abruzzi was present at the first and second representations, and going behind the scenes, congratulated "Rossana," recommending her to have the drama translated into foreign languages, especially English. Its success was so great that the author has made arrangements for it to be given here in Rome this autumn.

Besides her literary work, Rossana is Government Inspector of Women's Prisons and Reformatories. Her best known books are, "Maternity Is Not a Theory," "Simple Words for the People," and "Aspasia and the Century of Pericles." Something of what she knows about prison life and its mismanagement was set before the American people thru THE INDEPENDENT in an article of hers, called "The Islands of Lipari."

Besides these three great figures, Italy counts many women novelists of renown, who have written successful books.

"Neera" (Anna Radice Zaccari) as a child wrote on a window pane: "I am nine years old, I am ugly, and mamma scolds me always." This was her first literary effort, and gives the key to her later works. She never threw off her sadness, but her writing was purified by her early struggles. She has devoted her potent pen to the neglected class of old maids, whose position in the peninsula has much changed, but is still one of great inferiority. "Lydia" is her most popular work. She has also written "Teresa," "Tomorrow" and "Senio."

Several authoresses conceal their identity under *noms de plume*, such as the Livornese "Teresa," whose last novel, "Pare un Sogno," was a great success.

"Sfinge" is known particularly for her book called "The Masterpiece." She is the Countess Codronchi, but is known entirely by her *nom de plume*.

Grazia Pierantoni Mancini, Luisa Amalia Paladini, Paola Lombroso, daughter of the great criminologist, and so on, a galaxy of clever women of which any country might be proud.

ROME, ITALY.

The London Naval Conference

BY DR. ELLERY C. STOWELL

[Not since the Second Hague Conference convened in the summer of 1907 has there been a more important international gathering than the London Naval Conference described in the following article. Yet as the construction and development of international law upon which the peace of the world ultimately rests is scarcely ever featured or even noticed in our press, this is the first magazine article, we understand, which has appeared on the subject. Dr. Stowell was secretary of the Committee on Maritime Law (the fourth commission) of the Second Hague Conference and secretary of the American delegation to the London Naval Conference. He is now secretary of the College of the Political Sciences at Washington.—EDITOR.]

THOSE who followed the work of the Second Hague Conference are familiar with the convention establishing an International Prize Court composed of fifteen judges. It stipulates that the great maritime powers—Germany, United States, Austria-Hungary, France, Great Britain, Italy, Japan and Russia—shall each choose one judge, leaving seven to represent all the other countries of the world.

Article 7 of the Prize Court Conven-

tion regarding the competence of the judges declares:

If a question of law to be decided is covered by a treaty in force between the belligerent captor and a Power which is itself, or the subject or citizen of which is, a party in the proceedings, the Court is governed by the provisions of the said treaty.

In the absence of such provisions, the Court shall apply the rules of international law. If no generally recognized rule exists, the Court shall give judgment in accordance with the general principles of justice and equity.

Certain states felt a reluctance to

leave such a tremendous power to the court; for a majority of the judges could decide in favor of one or the other of the great systems of rules applying to the conduct of naval warfare, and with a stroke of the pen do away with principles which nations had given their blood and their treasure to maintain, and which they had always considered the foundation of their national life and aspirations. If some agreement could be reached as to the main principles of the international law of maritime warfare, it was thought the Court would then fulfil the high functions without any danger that its decisions would imperil the vital interest of any power. Moved by these considerations, Great Britain called a conference of the great naval Powers to agree upon the rules of international law applicable to naval warfare; more especially those governing the relations of belligerents and neutrals.

The conference, which met in the Foreign Office, Downing street, was composed of delegates from the Powers above mentioned, to which were added Spain and the Netherlands—the latter, because the Prize Court, when established, will sit at The Hague.

Many of the men most active at The Hague met at London to renew their discussions. The American delegates were Rear-Admiral C. H. Stockton and Prof. George G. Wilson, of Brown and Harvard universities. Admiral Stockton is well known for his fine record in the navy and his services in the field of international law—when president of the Naval War College he drew up the first code of "Laws and Usages of War at Sea." Our Government submitted this code in the hope that the greater number of its provisions might be adopted by the conference. Professor Wilson is, after Prof. J. B. Moore, our foremost authority on maritime international law, having for several years presided over the discussions at the Naval War College.

The theory of the Hague Peace Conferences is that they legislate, but have no authority to declare what the law is—in reality, in declaring what the law of nations is to be, they generally do no more than incorporate into an approved text the laws which have already re-

ceived quasi unanimous approval. The Naval Conference, on the contrary, was called to determine what was the existing law, its function being to reach an agreement as to the application of Article 7, which refers to the enforcement of treaties and the law in existence. If the conference had done nothing more than draw up a convention, the Powers not represented at the conference would hardly consider themselves bound by its provisions, but a declaration containing the expression of what all ten Powers consider to be the actual law will be much larger in its scope. Much of what the convention contains is really the enunciation of the common principle which lay beneath practices apparently entirely dissimilar. In other cases, the delegates reached compromises which, strictly speaking, should have merely the force of a treaty obligation as regards the signatory Powers; but in point of fact, it can hardly be doubted that any regulations adopted by the greatest maritime Powers with such diversified interests and geographical situations will command the respectful consideration of the whole world, especially of that high tribunal, a majority of whose judges are to be appointed by the Powers represented at the London Conference.

The seventy-one articles of which the convention is composed cover blockade, contraband, unneutral service, destruction of neutral prizes, transfer to a neutral flag, determination of enemy character of ships, convoy, resistance to search, and compensation for illegal seizure. This disposes of all the questions contained in the program submitted by Great Britain when calling the conference, except the conversion of a merchant vessel on the high seas into a man-of-war and the question whether the nationality or domicile of the owner should determine the neutral or hostile character of property at sea. Of all these contraband is undoubtedly the most important. The provisions of the declaration will make it possible for the shipper to know just what articles are contraband while the free list makes it impossible to seize raw materials and other important articles of manufacture. Knowing what articles are absolute contraband, he will have no fear that the belligerent may

apply the harassing doctrine of continuous voyage to any others. The abandonment of continuous voyage, as applied to conditional contraband, was the pivotal point about which the conflict of interest in the conference centered. The American delegates held out until toward the end for its unrestricted application, and it was their final concession which made possible an agreement acceptable to all. In America much sentimental interest attaches to this doctrine, which was so useful to our Government in its struggle with the Southern States, but the best naval opinion considers its retention for relative contraband likely to be more dangerous than useful to us in the future. Anglo-American jurisprudence secured a perpetual recognition for this doctrine in the case of absolute contraband. The provisions relating to blockade were mutually acceptable, because they resulted from a close study of the actual practice, from which it was ascertained that the so-called Anglo-American and Continental systems were not so divergent as supposed. The limiting of the seizure to the area of operation of the warships detailed to render the blockade effective, and the abandonment of the Continental contention requiring the notification of each ship of the existence of the blockade before seizure, resulted in an acceptable set of regulations. Perhaps none were more surprised to find an agreement regarding the destruction of neutral prizes possible than were the delegates themselves. This happy result was due to the large and conciliatory spirit of the great men who were delegates from the various countries. At the next Peace Conference it may be possible to reach a similar agreement regarding the conversion of a merchantman into a man-of-war on the high seas. More difficult and more important is the question whether domicile or nationality shall determine the neutral or enemy character of sea-borne commerce. If more American States had been represented at the conference, a more vigorous support of the doctrine of domicile as opposed to nationality might have been found. But the countries which export men are anxious to conserve their influence by the maintenance of the prin-

ciple of nationality, and they marshal their trained jurists against the great logical principle of domicile. At future conferences this country will undoubtedly be prepared to champion the doctrine of domicile as vigorously as it did at this.

As drawn up, the Declaration of London awaits the ratification of the signatory Powers. They will not hesitate to accept such an admirable instrument. But even without ratification its provisions have so justly taken into account the necessities of belligerent action and neutral interest that it would impose itself upon the world by the sheer force of its reasonableness. Toward the end of the conference the American delegation submitted a proposition made by our Government to constitute the Arbitral Court of Justice contained in the project annexed to the final act of the Second Peace Conference, and to allow the judges of the Prize Court to sit also as judges of the Arbitral Court. The conference recognized that the enforcement of many of the provisions contained in the Declaration of London were not within the competence of the International Prize Court, but the delegates were of the opinion that such a proposition should form the object of a special convocation and could not properly be considered by the London Conference. The willingness of our Government to make this proposal shows its interest in forwarding the cause of arbitration. The delegates at London expressly declared that their disinclination to consider the American proposal at that time was not in any way to be attributed to hostility toward the project. We may, therefore, hope for the early establishment of this illustrious body.

The world owes a debt of gratitude to Great Britain for convoking the conference. The more so, when we remember that not until very recently has she been willing to consider the possibility of any international regulations to govern maritime warfare. At the first Hague Conference she made it a condition of her attendance that all matter connected in any way with maritime warfare should be excluded from the program, and now she has met the delegates of the great Powers of the world in a

spirit of real conciliation and encompassed the great result for which she convoked the conference.

At the recent meeting of the American International Law Society in Washington, Admiral Sperry closed his remarks upon the Declaration of London with the following words:

"In order to mark the advance made by the London Conference beyond the point reached by the Second Hague Conference only a few of the most important questions have been touched upon, but in general it may be said that the work done in harmonizing the varying practices of the English and Continental prize courts so as to provide a body of conventional law, neither too vague nor too rigid for the guidance of the International Prize Court, is remarkable. It is all the more remarkable because the English and Continental systems grew up side by side during the great maritime wars of the eighteenth and nineteenth centuries and were apparently irreconcilable since one was the law of the blockader, seeking to increase the effectiveness of the blockade, and the other was that of the blockaded, seeking to relax its stringency.

"Inspired by a personal knowledge of the laborious, trying and apparently futile discussions which were prolonged for nearly five months at The Hague in 1907, my congratulations on the work done by the London Naval Conference are most profound. Without the declaration I am compelled to believe that the

International Prize Court would have proved a snare and a delusion instead of being a safeguard of inestimable value to the rights and interests of neutrals and belligerents alike, as it will be if this declaration is ratified. International conventional laws make an international tribunal logical and necessary."

Not only those interested in naval warfare should rejoice at the results obtained, but the lovers of peace as well, because the expansion of the realm of law over this great branch of human relations will do much toward engendering among the nations a feeling of responsibility to a common law. That feeling, and the declaration itself, will do much toward facilitating the establishment of international organs like the International Prize Court. Relatively, too, this convention is one of the greatest instruments of peace, for its rules, like the whole principle of neutrality, will have the effect of confining hostilities to the actual belligerents in conflict and will prevent the widening of the struggle, which, in the past, often resulted from a belligerent's too egotistical interpretation of the old confused and conflicting rules of international law governing maritime warfare.

WASHINGTON, D. C.

The "Tongue" Movement

THIS is an illustration of the religious insanity which may overcome those who are not properly educated. But who do not possess the self-control given by intelligent study of evidence and of mental activities, it is well worth while to read this article. It is written by one who has had full opportunity for observation, and we have verified its statements by reading the literature published in Los Angeles by these strange religiousists. (Frank L.

A DESIRE to possess the "gift of tongues" has been a recurring one in the history of religious enthusiasm. A natural ambition was to possess a "tongue" that others could understand, and from time to time religionists have come to the Orient and patiently awaited the "gift" of the Chinese or Japanese language for use in mission work, making no endeavor beyond persistence in prayer. Such people have in time exhausted their small means, even the living with the economy of the natives, and have been sent home by the charitable. Of late, however, a propa-

ganda is circling the globe, with Atlanta, Ga., and Los Angeles, Cal., as American centers, which seeks for the faithful, not necessarily "tongues" that are comprehensible to others, but unknown tongues which, it is claimed, others can understand only in cases of exceptional credence. The attainment of this "gift" is regarded as a token of divine approval; and it is a curious sight to see a company of the unemotional Chinese swept by this strange delusion, kneeling or prostrate on the ground, their eyes closed, their faces set in frenzied abstraction, pouring out for hours a

stream of meaningless sounds. It is presumably a study in hysteria, for, in their publications, the converts report "hours of laughter," which they interpret as a divine incitement. The scientific significance of this phenomenon the writer is not able to discuss; it may be that by intense dwelling on the desirability of thus speaking, hypnotic suggestion kindles this power of pouring forth a fluency of meaningless sounds. If the adherents were with equal earnestness enjoined to climb trees or to beat the air, the frenzy would take that form. But certainly these fanatics pour forth heterogeneous sounds with a vehemence and passion that no uninspired imitator can equal. While the literature of the curious faith does not touch on this point, it is said to be held by many of the petitioners that the attainment of this power to babble meaningless things is a condition of salvation; that unless attained the petitioner is lost. This horrible delusion may explain the intensity of the fanatics in their exercises. It does not appear that any other phase of religion interests them except this pursuit of tongues.

The following is an abstract from a letter dated "Dhond, India, October 18th, 1907," appearing in an American publication (*Trust*) from a young woman missionary of the faith. Not many of the adherents are as confident as she that she is comprehended in her utterances:

The Lord met me in every place, and gave evidence of at least one instance in each place, that the Holy Spirit spoke thru me and that the people understood. In Shimonoseki, Japan, I addressed a company of Japanese, beginning to speak to them in English with an interpreter who volunteered. But immediately I found myself talking to them in a tongue in much power of the Spirit, told them the story of the cross, and gave them the invitation—"Ho every one that thirsteth," etc., and "If any man thirst, let him come unto me and drink." And the interpreter told me that they understood me. Then at Manila in the Philippine Islands, I stopped a boy on the street to inquire for a place, and as I tried to tell him of Jesus and His love, the Spirit gave a message in a tongue. Instantly the boy, with a shining face, said, "You speak Tagalog," which is the common language of the people in Manila. I said, "Did I?" He replied, "Yes, a little."

Then on the Italian steamer from Hong Kong, there were over 500 Chinese coolies. Among them were three Chinese girls, who did not know a word of English. I spoke to them

in a tongue so they understood. When I spoke to them in English, their faces were blank and they did not answer, but when I spoke in a tongue, their faces brightened and they answered me back in Chinese, looking very pleased. The Italian doctor of the steamer heard me speaking to them, and thru him the report went about on the ship that I was able to speak in Chinese. Then on the same steamer there were sixty-five Hindus in the crew. One of the wheel men was watching me one day on deck, and I was led to speak to him in simple English about his home and family. I had a hard time to make him understand anything. Then I began to talk to him about Jesus, when suddenly the Spirit began to talk thru me in a tongue, and he bowed his head, touching his hand to his forehead, and looked very solemn. The next day the Italian captain of the steamer said to me, "You speak Hindustani and Chinese." The man must have told him, because no one else was present. Then this same man carried my satchel off the boat at Bombay, and seemed perfectly surprised that I could not speak to the driver of the carriage in Hindustani.

Altho I have not yet spoken in Marathi, still I have the promise from God that I will when I am humble enough and perfectly free in spirit to allow no hindrance from others. Praise God! He is teaching me many things. One is, that I must use the power which He has given me in prayer and testimony, whether I am understood or not.

This is the letter of a sincere person of most ignorant and undisciplined mind; in fact, the ignorance of these "Pentecostal" or "Tongues" people is the primal fact in considering the movement. The Americans in it are, as a rule, the "poor whites" of the South—intensely religious and by their ignorance fanatically bigoted.

The harm that such crusades do in China lies in unsettling the native churches. A "Tongue" orator would get no hearing in addressing a native heathen audience, only astonishment and ridicule. It requires persistent hearings for the Chinese to comprehend what Christianity is all about, and this preliminary work the native Church does. It is gratifying to report that in the main these sensible native Christians recognized the falsity of the "Pentecostal" manifestations. As for the missionaries from home, only in isolated instances did their hospitable welcome of religious zeal mislead them, and some who regarded the pitiful hysteria as a spiritual expression now regret their delusion. The Christian and Missionary Alliance (Dr. Simpson's work), how-

ever, is sharing in these extravagances; its missionaries "speak in tongues" and interpret each others' jargon, to the painful disappointment of their friends, who have appreciated their self-sacrifice and earnest work among the Chinese.

From the saintly Jonathan Edwards down to the most darkened fanatic, over-accentuation of individual passages of the Bible and isolated items of religious teaching, with a loss of the full viewpoint, has led to error. Surely there never was such a strange and pitiful development as this conception of the religious life as taught by the Master. How dangerous it is remains to be seen. The history of these group movements, these fanciful propagandas led by ignorant individual men who come to believe themselves especially authorized to hand out truth to their blind followers—the sorry history of such movements is that they soon run into immorality. An inspection of the journals devoted to the crusade already reveals the thin ice. *The Apostolic Faith* is published in Los Angeles. A leading article, "To the Married," by the head man of the cult, reads as authoritatively as Holy Writ. It begins:

"In these days so many deceptive spirits are in the world that we have felt impelled by the blessed Holy Spirit to write a letter on the seventh chapter of First Corinthians."

The article carries some astonishing theories, but the really ominous part is the conclusion:

"I have been asked so much on this question and I can only give what God has revealed to me thru His precious Word. Bless his holy name."

This self-confident leader shows that thus far at least he is on sure ground. In answer to a query, he replies:

"We found no Scripture where the preacher could be engaged in this blest Gospel Ministry with two living companions."

The excitement began in South China with the arrival in Hongkong last fall of a man named A. G. Garr and his wife, their three years old child, a negro woman (whom the neighbors describe as "the best of the lot") and two young women. Garr was from the Los Angeles center. He was formerly a railroad employee and a Methodist. He then passed into the "Burning Bush" order—a body, certainly, with scriptural

warrant as regards title. As to whether this brotherhood ejected him or he was not sufficiently spiritually fed, the gossips differ; but at all events he is now a shining light among the "Tongues" people. The newcomers took quarters on Ladder street, among the Chinese, and soon the meetings were attracting great crowds, including many who came to scoff, but did not remain to pray.

Garr dealt largely in abuse. The visitor entering the hall caught loud tones of denunciation, and when he retired some fine specimens of anathema followed him into the street, often with a personal application. Garr frankly consigned to the bad place the faithful missionaries of Hongkong, from whose native churches and converts, more or less schooled in Christian teaching, his audiences were exclusively drawn. The work has caused some division in these native churches, altho there has been some abatement in the frenzy, and the Chinese, regretting their digression, are returning to their folds. The meetings drew 300 people night after night. Hundreds went under the spell, shaking and shouting in "tongues," and in general conducting themselves like howling dervishes. In fact, the manifestations may be paralleled in many heathen tribes—they suggest the frenzy of the Igorrotes' exercises, familiar to visitors to recent American expositions. The sad part of it is that the absurdity is predicated on Christian teaching.

But the Garrs have gone home. Smallpox caused the death of the poor old negro woman and the Garrs' child, who was neglected in life. And when the two young women were taken to the pest ship in the harbor with the same disease, the Garrs quietly boarded a steamer and went back to Japan, where are others of the brotherhood, and probably returned to America. Of course, the enthusiasts would have no medical attendance.

There is another group of these curious fanatics now in Canton. One McIntosh is at the head of a half dozen American women. He is cast in a gentler mold than the authoritative Garr, but his ignorance is so great that he can read only simple English. A wealthy Chinaman of Canton, a much esteemed

native church convert, is financing this company and is reported praying day and night for "tongues," that he may escape the doom. This Canton group has annexed a young woman whose case is peculiarly sad. She belongs to a notable Southern family and was engaged in legitimate mission work for four years, acquiring the Chinese language. She acts as interpreter for McIntosh and his associates, and is now fanatically opposed to her former associates, the most devoted of Christian workers. Her health is obviously impaired and her mind may become wholly unhinged, as some of the Chinese converts are now under restraint. At last reports McIntosh needed a few more dollars to complete a fund to get him to the Holy Land, for which his fanaticism longs.

The work in Hongkong is carried on by a very intelligent Chinese, formerly in Government employ. He interpreted for Garr and so became indoctrinated with the teachings. Interest has flagged in this city, but this Mr. Mok and some twenty others may be seen at their profitless posturings and repetitions for hours at a time.

Some recession in the enthusiasm is reported from India, where certain missionaries have recanted their faith in the shakings and babblings as wholesome spiritual manifestations, but the papers devoted to the work report mission bands sent to Africa and other parts of the world, and the "testimonies" from many lands, in most extravagant and ignorant language, suggest how widespread the delusion is.

HONGKONG, CHINA

The New Spirit in India

BY SYDNEY BROOKS

[Our readers are already familiar with Mr. Brooks's many articles in THE INDEPENDENT on English and European public questions. He is one of the leading British Publicists.—EDITOR.]

FOR the past two or three years it has been ominously evident that the easy days of British rule in India are over, and that difficulties of a wholly novel, serious and perplexing character are pressing upon the administrators of the great dependency. There has been something more than unrest; there has been positive disaffection. For the first time assassination and bomb-throwing have found a place among the weapons of political agitation. Great popular protests against certain acts of Government, a boycott of British goods, an incipient boycott of all the agencies of British rule except the tax collector, a steady advance of the Indian reform party toward a propaganda of violence, a growing and pervasive sense among the diversified myriads under British rule of some underlying unity, stern measures of repression and the imprisonment and deportation of one popular leader after another, an exasperation of

all the many elements of racial discord—such are the phenomena that fifty years after the suppression of the Mutiny, fifty years after the end of the old East India Company and the assumption of Crown Government, confront the British in India. It is a baffling situation and one full of terrible potentialities. No more anxious problem faces British statesmanship in or out of the empire. Every enemy of England is taking the discontent in India into his calculations as hopefully as ten years ago he watched the dawn of the irrepressible conflict in South Africa. Every friend of England must be wondering whether the limits of British governing capacity have been reached or whether she will rise, as of old, adequately and more than adequately, to the stress of the new ordeal. For in the scheme of British interests India is more than merely India. So far as a foreign policy of such vast and uneven circumference

as Great Britain's can be said to have a single center, that center is India; and an India seriously disturbed is bound to react with an almost instantaneous force upon British interests everywhere. I do not say that there is as yet any danger of India being seriously disturbed—disturbed, I mean, to the point of necessitating a large increase in the British garrison. But a new spirit is palpably stirring among those dusky wards of empire; the tokens of friction and unrest are menacing and indisputable; and Great Britain, outwardly calm—it is amazing how few Englishmen have any real knowledge of or interest in India—is inwardly perturbed, is searching for the causes of the novel manifestations that assail and perplex her, and hardly disguises the consciousness that her governing aptitudes are about to be tested as they have never been tested before.

At such a time the appearance of a book dealing sympathetically with what one may call the Indian case against British rule is peculiarly welcome. It is welcome whether one agrees with it or not, if only because there is often more to be learned from a vital, friendly, even an over-friendly, statement of a single side than from a dispassionate presentation of both sides. What England needs more than anything else at the present moment is to understand the Indian point of view; and the more sympathetically it is interpreted the better her chance of appreciating it. When, therefore, a man comes forward, and an Englishman at that, whose instincts are all on the side of the under dog, who has visited India and learned at first hand the desires and grievances of the Indian reformers, and who knows, besides, how to set them forth in a winning and persuasive style, he is rendering, in my judgment, a public service which his countrymen should be quick to recognize. This is what Mr. Henry W. Nevinson has done in "The New Spirit in India" (Harpers); and in all England I do not know a man more qualified by gifts of mind and temperament for the task. Mr. Nevinson is one of the most interesting and attractive personalities in London journalism. A literary critic of fine catholicity, of smiling, caustic humor and of sure perceptions, he is also

a born revolutionist, one of the most vivid of war correspondents, and an ardent humanitarian. The smugness, and conventions, and entrenched respectabilities of English life; the obtuseness and insularities of the English spirit; the whole scheme of English civilization, revolt him as they revolt an Irishman or a Frenchman. He has the crusading nature as Mazzini had it, or Rousseau, or Tolstoi. Every impulse of his being makes him an extremist; and his life, as full and adventurous as any man need hope for, has helped to confirm and fortify his engaging and exalted rebelliousness. Hardly a movement of popular discontent seems to spring up anywhere that Mr. Nevinson does not plunge into it. One hears of him at one moment deep in the counsels of the Russian revolutionaries; at the next he is in the thick of Balkan politics; a little later and he is presiding at a woman suffragist meeting in London, or wandering thru the Caucasus, or campaigning in Greece or South Africa, or investigating and exposing, at daily peril of his life, the iniquities of the slave trade in Portuguese Africa.

It was inevitable that sooner or later the unrest in India should claim his sympathies and attention. It was inevitable, too, that he should approach it with all his sentiments keenly enlisted on the native side. One must, of course, allow for that. One must be prepared to find "The New Spirit in India" animated thruout by the extremist temperament of its author, British rule and conduct deftly belittled and criticised, and more than justice done to Indian aspirations and character. If, therefore, I were asked whether Mr. Nevinson's latest book may be taken as an impartial and trustworthy guide to the entire situation in India, I should say that it cannot be so taken. But if I were asked whether it may be accepted as a full and revealing statement of the causes of Indian discontent, my reply would be at once and gratefully in the affirmative. Every point that can tell in favor of the Bengali and against the British Raj is made and pressed home with exquisite skill. It is partisanship, of course; but it is the unconscious partisanship of sincerity and conviction, and not of advocacy; and for

that very reason it is helpful and illuminating. It was none of Mr. Nevinson's business to present both sides. It was his business to examine and expound the case for the natives and to lay it before the world, and especially before his own countrymen, in the most telling and attractive form. An inquirer coming fresh to the study of Indian problems would feel, after reading Mr. Nevinson's book, that he had a clear and intelligible grasp on the causes and aims of the new agitation. He would fail, however, to envisage those causes and aims in a true perspective, in relation, for instance, to many other factors that statesmanship would be obliged to take into account; and he would have no opportunity of hearing anything there is to be said on the British side. A tone of subtle disparagement of the methods, manners and spirit of the British rulers runs all thru the book; Mr. Nevinson's scheme and purpose inevitably excluded anything like a candid review of their achievements; when he finds anything to commend, his approval is given with an almost palpable reluctance; and he is a past master in the art of attaching to a man, a policy or an attitude the dexterously damning epithet that it is so easy for a man of his literary gifts to bestow and so difficult for any one else to refute.

The great Durbar, for example, that celebrated King Edward's accession, is mentioned by Mr. Nevinson only to be dubbed "the foolish Durbar." One could make out, I think, a convincing case to show that it was anything but foolish; but it would require pages to do it; very few would trouble to read them; and Mr. Nevinson's single, offhand, flashing adjective would probably in the end remain in the memory long after the laborious proofs of its injustice had been forgotten. And that is but a small, tho not insignificant instance of a spirit visible in every one of these captivating pages. As a rule, I think it the very degradation of criticism to find fault with an author for not doing what he had no intention of doing. But in this case a caveat may fairly be entered against the assumption that Mr. Nevinson's study of the new spirit in India either covers the whole ground of the

Indian question or gives the British Raj even a tithe of its due. So far as I have been able to test his statements of actual fact I have found them unimpeachably accurate. But the suppression of innumerable other facts that lay outside the scope of Mr. Nevinson's purpose and the strong and constant bias of his intellect and emotions results in giving the uninitiated reader a decidedly distorted view of India as a whole. I say this not in the least as a condemnation of Mr. Nevinson, who has entirely succeeded in his defined and limited aim, but as a warning to his readers. They must not think that they are getting a bird's-eye view of India; they must remember that outside the problems of which Mr. Nevinson treats there is a vast margin on which he scarcely sets foot. To realize this, however, is in no way to minimize the value and the absorbing interest of Mr. Nevinson's achievement in reproducing, with the insight that sympathy alone can give, the essence and motives of the new spirit that is at work in India. Still less is it to remain insensible to the literary charm of his volume and to the rare personality it so pleasantly reveals.

The unrest in India is the resultant of many forces, a reservoir fed from many streams. In its present acute and menacing form it dates from the partition of Bengal in 1905, its administrative division, that is to say, into two provinces. The partition was devised and carried thru by Lord Curzon in spite of the vehement and sustained opposition of the Bengalis, who found themselves cut in two, jumbled together with people of different races, tongues and degrees of civilization, and many millions of them deprived of their historic capital of Calcutta, with its university and high court of justice. The official justification of the partition was "administrative efficiency." Its true origin is believed by practically all Indians to have been Lord Curzon's personal dislike of the Bengali race, coupled with a desire to weaken their political influence. Lord Morley has himself admitted that "nothing was ever worse done in disregard to the feeling and opinion of the majority of the people concerned"; and Mr. Nevinson movingly describes how Chamberlain, on the anniversary of that national

wrong," has now become the Ash Wednesday of India. "On that day," he says, "thousands and thousands of Indians rub dust or ashes on their foreheads; at dawn they bathe in silence, as at a sacred fast; no meals are eaten; the shops in cities and the village bazaars are shut; women refuse to cook; they lay aside their ornaments; men bind each other's wrists with a yellow string as a sign that they will never forget the shame; and the whole day is passed in resentment, mourning, and the hunger of humiliation." The partition led directly to Swadeshi—that is, to an economic boycott of English goods on a far more pervasive scale than the Chinese boycott, a few years ago, of American goods. It stimulated extremist sentiment everywhere; it gave the decisive impulse to the efforts of the Bengalis to wipe out the old reproach of effeminacy and mendacity, and to remake themselves on a higher level of physical and moral hardihood; it suggested and encouraged the idea that Indians, by simply ignoring the foreigners in their midst, by encouraging every form of Indian produce and manufacture, by boycotting British schools and law courts, and establishing a native educational system and native arbitration courts in their place, and by extending the basis and functions of the national congress, might evolve a *de facto* home rule government of their own; and to it most of the turbulence, crimes, riots and disaffection of the past three years is directly traceable. But beyond all this, the partition and the manner in which it was carried out had the effect, as Mr. Nevinson puts it, of convincing the Bengali people, and thru them the vast majority of educated Indians, that England "no longer cared what happened to them or their country, provided they paid the revenue and kept quiet."

But the partition of Bengal merely hastened the coming of a phase of British experience in India which other older and deeper causes had long made inevitable. "I think," says Mr. Nevinson, "some kind of unrest would have been developed within the next few years in any case. It arises from all manner of deep-lying causes—from the success of Asiatic Japan in war against a great

European Power, from the general communication by railway, the visits of even high-caste Brahmins to Europe, the use of English as a common tongue, the increasing knowledge of our history and liberties, and the increasing study of our great Liberal thinkers and John Morley's works. Add to these things the growing alienation of the subject races, owing to notorious cases of injustice in the law courts, ill-mannered arrogance on the part of certain Anglo-Indians, abusive incitements to violence by Anglo-Indian newspapers, and a system of espionage by the police and postal officials." The result of these various influences is, first, a distinct waning in the confidence of educated Indians in the justice and benevolence of British rule; secondly, an increasing resentment against the patronizing, aloof and supercilious manners of the English; thirdly, a growing tendency to criticise and abuse the Government, to hold it responsible for plague, famine, malaria, and to accuse it of draining India of her wealth and suppressing her industries in the interests of English administrators, financiers and traders; fourthly, the birth of a new consciousness of unity among Indians and of a new spirit of self-reliance; and fifthly, an insistent desire for a larger and ever larger share in the government of the country. The remedies Mr. Nevinson suggests include a modification of the partition of Bengal, the appointment of at least one Indian on each of the executive councils, the enlargement of the Viceroy's and other legislative councils by genuinely elected members up to the number of half the council, an effective control over the budget, an increased expenditure on education, the free and unprejudiced admission of Indians to all posts in the civil service for which they are qualified, the reform of the police and the separation of judicial and executive functions in the case of the local administrators. But above all he lays stress on the necessity of a "change of heart," a fundamental alteration in the manners and bearing of individual Englishmen toward individual Indians.

These proposals may roughly be called those of the Moderate party, with whom Mr. Nevinson, in his last chapter—and

rather, one suspects, reluctantly -elects in the end to side. They are those of the party that accepts British rule as essential to India's internal peace and external security, but desires to make it more directly responsive to native opinion. Now, it is extremely noteworthy that the scheme of reforms outlined by Lord Morley last December not only embodies many of the planks of the Moderate platform, but at some points goes beyond them. One of the Moderate leaders, indeed, frankly and publicly stated that Lord Morley's proposals exceeded their wildest hopes. The partition of Bengal remains, it is true, untouched, and there seems at present little prospect of reversing or even modifying that gratuitous blunder. *Fieri non debuit; factum valet* is apparently Lord Morley's last word on that difficult matter. But in other directions he has not only met the Moderates more than half way; he has positively given them a lead. Mr. Nevins, for instance, suggests the appointment of an Indian on the Viceroy's Executive Council—that is, on the supreme governing body of the country. The appointment is to be made. He suggests that an Indian should be appointed on each of the provincial executive councils. That, too, is conceded. He suggests that the Viceroy's Legislative Council should be enlarged by genuinely elected members up to one-half of the total number. Lord Morley is increasing the Viceroy's Legislative Council from twenty-four to sixty-two members, twenty-eight of whom will be elected, thus leaving the Viceroy with a very small official majority. Mr. Nevins makes a similar proposal in regard to the legislative councils of Madras, Bombay and the other provinces. Lord Morley has bettered the proposal not only by remodeling these bodies, but by handing over to the elected and nominated Indian members a clear majority over the official element. In future the native representatives on these legislative councils will be in a position to propose and pass whatever legislation they please, subject, of course, to the veto of the Governor or Lieutenant-Governor, and to the reserved powers of the central Government. That is a very great and whole-

some change. It makes the responsibility of the native members a living thing. It places them *vis-à-vis* the Governor or Lieutenant-Governor in almost precisely the position that Congress occupies *vis-à-vis* the President. Mr. Nevins, again, proposes that the native members on the Viceroy's Legislative Council should be given an effective control over the budget. Lord Morley intends to invest them, in his own words, with "the novel right of moving resolutions and dividing the Council on administrative questions of public interest, and of taking part in settling the actual figures of the budget, both by informal discussion and by bringing forward specific recommendations which will be put to the vote."

It will thus be seen that most of the reforms put forward by the Moderates as the maximum of their demands have been adopted in their entirety and that others have been promised which go considerably beyond anything the Moderates had dreamed of asking for. The effect of Lord Morley's statesmanlike liberality is already very apparent. He has conciliated and rejoiced the responsible leaders of the educated classes and he has done so without alienating the English officials in the civil service. The path is opened to a kind of co-operation between the rulers and the ruled that may in time produce that "change of heart" on which Mr. Nevins rightly insists as the most needed, if the most intangible, of all reforms. There will, at any rate, be a new and wider knowledge of how the natives think on this question and on that, and a new necessity on the part of the Government of carrying native opinion with them in the measures they propose; and the most useful Englishman in the India of the near future, the man most obviously marked out for promotion, will not, as now, be he who is most skilled in compiling reports, but he who shows the most knowledge of and influence over native opinion and the most dexterity in guiding instead of driving the people along the road to better things. In other words, Lord Morley's reforms may easily prove the first step toward making *popularity* what it always should have

been, but never has been—one of the first and most desirable objects of official policy.

I feel it possible, therefore, to end on a note of comparative cheerfulness. There is a crisis in India and there will always continue to be one. As in Russia, so in India, education spells the doom of bureaucracy, whether it be despotic or benevolent; and no one can for a moment suppose that Lord Morley's reforms, timely and generous as they are, mark the end of the struggle or establish a perfect and final equilibrium between native aspirations and British supremacy. The sphere of Indian influence and direction is bound to expand, while that of British influence and direction is bound to contract; and the ultimate resultant of these two simultaneous processes is far beyond my powers of divination. But for the present Lord Morley, by sternly repressing anarchy on the one hand and by ungrudgingly satisfying the new spirit of self-restoration on the other, has righted the ship of state and piloted her into smoother waters. That is a very considerable achievement, and there are only two further points in connection with it that I should like to dwell upon. The first is that while a training in self-government has always formed part of British policy in India it is a program that in a country so infinitely diversified and divided against itself—a country of over forty races, nine religions, twenty-four hun-

dred castes, and one hundred and eighty languages and dialects—can only be carried out step by step and with the utmost caution. Situated as the British are, a mere handful of foreigners among three hundred million credulous natives, there is no danger so great as that they may be hurried into premature concessions for which the masses of the people—who, remember, dwell contentedly under British rule—are not prepared, which are demanded only by a numerically insignificant minority, not more than from one-third to one-sixth of one per cent. of the population, and which, unless carefully safeguarded, may provoke, not a healthy political rivalry, but disastrous outbreaks of racial and religious antagonism. The second point on which I should like to venture a word is this, that the present difficulties that confront the British in India are far more the result of their successes than of their failures. They could not, indeed, have arisen at all had not the British Raj been a superlative material success; had it not preserved an unbroken peace, fenced with numberless securities the persons and property of the natives, promoted their well-being, educated them, and instilled into them by the reflex power of British precept and example the doctrines of liberty. It is no paradox to assert that nine-tenths of the tumult in India is at once the price and the proof of the excellence of British rule.

Success

BY E. H. ELLSWORTH

Success is the hand trained to do its work,
The eye that sees that the lines run true,
The ear that hears when the truth you shirk,
The brain that conceives old truths anew.

Success is the strife with the heart aglow,
The effort we make for our fellow man,
The pride that laughs at the outer show,
The soul that fulfils its highest plan.

LONDON, ENGL.

Literature

Marriage a la Mode*

THE average American reader has never been attracted by the eclectically constructed heroes and heroines of her novels, even when they were composed of the heads, wings and other oracle feathers of half a dozen of England's greatest portrait painters, as was the case with Fenwick, the hero of her Romney story, or of France's most famous demi-mondes, as was the case of Lady Rose's daughter. But her publishers need have no alarm for the success of her last book. It is too offensive and bigoted not to attract attention. In it will be found the least flattering, most insulting estimate of American womanhood that has yet been offered to the public. The American man scarcely appears except in the character of Captain Boyson, a toady to English ideals.

The scene opens in Washington, and we might almost infer that the topography at least is taken from the diary Mrs. Ward kept during her recent visit to this country, and for the first time we have a view of her in one of her own novels behind a tourist's mask, wearing her company manners. Before attacking them she is almost *naïve* in returning thanks to her American hosts for a day at Mount Vernon and for an invitation to a White House reception. She nearly gets her own sunset flush and tone of time upon Washington's country home. But there is something strained in her nice speech about the President, whom she compares to a rocky headland, and softens as much as she can the fact that he talked louder than any one else at his own reception. But in spite of this paying of guest duty to American hospitality in the first chapters, she manages to introduce the hero and heroine and to lay the foundations for their unhappiness in their first conversation.

Roger Barnes is a handsome young Englishman who comes to America frankly upon a fortune-hunting expedi-

tion. He has excellent ideas of how circumspect a woman ought to be even in what she knows, and particularly in what she thinks, and he is moral enough himself, except that he wants to sell his figure and family tree for a million dollars, which is an extravagant price to ask for himself, considering that he has no brains, no accomplishments, and that even his family portraits have been done over and damaged. The American girl he marries really loves him, in spite of the fact that she suspects he has reckoned up her bank account. She is the orphan of a rich lumber merchant who has control of her own fortune. She holds what Barnes considers shockingly loose views about marriage, but this does not prevent his marrying her and putting himself upon her pension list. It never deters any other Englishman from doing the same thing. At the end of three years she becomes jealous, restless, dissatisfied with life in an English country house, returns to America and divorces him. It is funnier than convincing to see how Mrs. Ward sets down the tragic effects of this action upon Barnes's character. He not only goes to the bad, but into a decline, refusing to touch his wife's pension, to which he is still entitled. This is not the real record we have of Englishmen and Frenchmen who have tried the patience of their American wives too far. They usually marry again and continue to live upon the first wife's pension with bitter grumbling because it is not larger.

But it is in the development of Daphne's character that Mrs. Ward writes her scathing indictment against American womanhood. She dissects with more shrewdness than any of us had reason to suspect she had the young American's egregious affectation of knowledge and taste concerning pictures and architecture. She hints that the brightness which passes for intellectual vivacity in young American women differs very early into pedantry, and one of the best scenes in the story is where Daphne gets

*MARRIAGE A LA MODE. By Mrs. Thompson Ward. Doubleday, Page & Co. \$1.20.

herself into contrast first with a vicious fine lady and then with a heavy, horse-faced old duchess, only to prove herself wanting in some fairer grace that both of them possess. But the chief charge is that Daphne is typical of American women in the fact that wealth, willfulness and other privileges have rendered her restless, unsettled, dissatisfied with any permanent environment, and intolerant even of the natural restraint involved in marriage. Mrs. Ward insists that altho a very large per cent. of the divorces in this country are granted to women, they do not ask for release in order to marry again, but because they are tired of being married at all. She thinks the period of passion is short in American women, and that, like Daphne, they spend the rest of their lives in one form of tyranny or another. There can be no question that divorce is a kind of diversion in the money-powered class to which Daphne belongs, as it is the refuge of millions of foreigners who relapse when they emigrate to this country into license from the restraints of marriage laws in the older countries. But it cannot be admitted that Daphne is the typical American woman. She is only typical of that class of American women who are willing to marry impoverished titled foreigners.

Some American readers may be puzzled by the stress which Mrs. Ward lays upon the question whether Daphne's husband knocked her down or merely pushed her off in such a way that she fell over and struck her head. The reason is that the British law regards unchastity in a wife as grounds for a divorce, but unchastity in a husband as a venial offense, not essentially impairing the sanctity of married life. Consequently, Daphne could not have got a divorce in England even if she had abundant proof of his unfaithfulness. There must be in addition "cruelty," which is practically interpreted in a materialistic sense. Then, too, if a wife forgives her husband, who, as a Christian, she is bound to do, she can never later bring up his offense against him. Another provision of British law which has been the cause of great hardship is that a wife who consents to a separation, perhaps in the hope of a reconciliation, is thereby debarred

from ever after suing for divorce, no matter what her husband may do after leaving her. And we may add finally, tho the list could be indefinitely extended, that only the wealthy classes in England can afford to get divorces, and this is the cause of widespread immorality, as English judges have admitted. The reader of *Marriage à la Mode* should look thru a few columns of the divorce proceedings in the *London Times*. He will find it unpleasant, because it publishes details which the yellowest journal in America would not dare print, but he will also see the workings of the legal system which Mrs. Ward prefers to ours. In short, she regards the American marriage laws as unjust and immoral, and we are equally convinced that the British marriage laws are unjust and immoral.

The Reorganization of Our Colleges

THE publication two years ago of "Individual Training in Our Colleges," by Clarence F. Birdseye, created a sensation in college circles because of its frank exposure of the demoralized condition of undergraduate life, due to lack of attention to the real needs of the student. Wherever the book was discussed the justice of the arraignment, in some degree at least, was admitted, but the discussions generally ended with the question, "But if it is so, what are you going to do about it?" This question Mr. Birdseye answers more fully in his new book *The Reorganization of Our Colleges*.* Here he subjects the college to the test of the business man—the test of efficiency. Does the college accomplish, economically and satisfactorily, its own professed objects? Is it turning out men of scholarly ideals, sound bodies and good morals, fit to become citizens and fathers of families? And what proportion of the material it receives goes to the waste-heap during the process?

Our universities have grown, like our industrial plants, into immense corporations, handling millions of dollars, and, what is more valuable, thousands of lives. Yet, unlike our industrial corpo-

*THE REORGANIZATION of OUR COLLEGES. By CLARENCE F. BIRDSEYE. New York: The Outlook & Training Co., 1907.

rations, they have developed no administrative organs capable of adequately handling effectively the heterogeneous aggregations. The professors are robbed of their time in order to do executive business, which usually they dislike and are often unfitted by temperament and training to do well. Any one who has tried to collect university statistics, even of such simple points as the number of students in a certain year or the expenditures for certain purposes, will realize how chaotic and undeveloped is the mere matter of recording. As for finding out what classes are being well taught, and why some students fail, and what becomes of them, not even the president, who is supposed to know everything, knows that.

Mr. Birdseye comes to this startling conclusion:

"After a pretty careful examination of college methods, and from a practical knowledge of the growth of accounting and business administration for thirty years, I am sure that, if our colleges would formulate and apply new units of value and up to date administration and accounting methods, they would quadruple in ten years their net results in wholesome training for citizenship, without a dollar's increase in endowment, and to the lasting satisfaction of all concerned, and at a relatively great saving in cost."

The average college man will probably not be ready to admit this. That is why the author is going to do what he can toward demonstrating it. For Mr. Birdseye does not write books for the fun of it, altho he has a shelf-full to his name. He means business, and he has organized a company for the purpose of investigating the real conditions prevailing in the classroom and the student home, and of applying such measures for the reform of their evils as observation and experience may direct.

The Actress. By Louise Closser Hale. New York: Harper & Bros. \$1.50.

Those who remember "Candida," as given in New York five years ago, will recall a particularly vivacious "Prossy"; the character actress who portrayed Mr. Shaw's spitfire stenographer is the author of *The Actress*, a novel of the stage and player-folk, which betrays in a good many realistic touches that it is partly, at least, autobiographical. The author takes us bodily and boldly into

the greenroom, and into the secrets of the make-up of a "character actress." A London engagement gives her an opportunity to mark the differences between the insular and the Western continental ways of looking at many things. The social recognition of an actress is more openly cordial in England; but she finds herself hemmed in by restrictions unknown in America, with a bland, "It isn't done," as their only explanation. *The Actress* tells a story, more common now than a half-century ago, of the struggle in a girl's heart between love and ambition.

The British Tar in Fact and Fiction. By Charles Napier Robinson, Commander, Royal Navy. With Introductory Chapters on the Place of the Sea Officer and Seaman in Naval History and Historical Literature by John Leyland. Illustrated. New York: Harper & Brothers. Pp. xxiii, 520. \$4.00.

It was an excellent idea of Commander Robinson's to trace the British sailor thru the centuries and to show the evolution of this, the most important element of the modern British navy. Tradition and heritage which reach back to the days when the men of the North swooped down on the shores of Britain, left defenseless by the departure of the Roman legions, are possibly of more value than Dreadnoughts. It was not the size or the superiority of the British ships in comparison with the great new navy of Spain which caused Drake's companion at Cadiz to write: "Twelve of her Majesty's ships were a match for all the galleys of the King's dominions." It was the seamanship and the mettle of the sailors—the men of whom Drake himself wrote to Queen Elizabeth in April, 1588: "I have not in my lifetime known better men and possessed of gallanter minds than your Majesty's people are for the most part which are here gathered together voluntarily to put their hands to the finishing of this great piece of work." It is well to remember that many of the traditions and much of the heritage of the sea of the British tar belongs to our own nation almost as much as to Great Britain. The seamen of Tudor days, the seamen of the mystery plays and of the poets and dramatists of the sixteenth and early seventeenth centuries belong to the days before any New

England ancestors had left their native shores, and for many years after the arrival of the early colonists, as Mr. Leyland reminds us, the sea traditions were carried on. With the opening up of the West the sea lost, for the United States, the preponderant importance which it still retains for a maritime country like Great Britain; but when the war fleets of the world are measured and compared, it should be remembered that the men behind the guns in the navies of Great Britain and the United States have a heritage of the sea which is lacking to some of the newer Powers which are energetically beginning to assert themselves as naval Powers.

The Enforcement of the Statute of Laborers. During the First Decade After the Black Death, 1349-1359. By Bertha Haven Putnam, Ph. D. Columbia University Studies. New York: Longmans, Green & Co. \$4.50.

Poverty in England is now claiming almost as much attention as the building of Dreadnoughts, and remedies and palliatives for a state of society in which almost half the population is below the poverty line are abundantly offered by reformers and philanthropists. How great the task is that is confronting the English nation and how deeply poverty is rooted in English life and history may be realized from a reading of Dr. Putnam's careful and scholarly treatise. In August, 1349, the Black Death reached Dorsetshire, and during the next twelve months it swept over the whole of England, carrying away almost half of the population. Its ravages were most severe among the poor, and after its disappearance in 1349, the men and women who were left naturally attempted to take advantage of the heightened demand for labor to secure higher wages and better conditions. Such efforts after life, liberty and the pursuit of happiness met with stern repression; and Dr. Putnam's investigations go to prove that the statutes whereby the English Government attempted to put down all efforts after betterment of condition, whether on the part of free or unfree laborers, were enforced with energy and effect. It is true that Parliament, while trying to keep wages down to the old level, endeavored

also to prevent any rise in prices of commodities; but how far these efforts were successful Dr. Putnam does not inform us. She gives abundant examples, however, of punishments by fine and imprisonment and by the forced repayment of the excess for the acceptance of wages above the customary and legal level. Apparently the only explanation of these natural and from the modern point of view not unpraiseworthy efforts on the part of the working people to better their condition, that occurred to England's governing classes of the fourteenth century, was that the inordinate demands were due to "the malice of servants."

A Working Theology. By Alexander MacColl. New York: Charles Scribner's Sons. 75 cents.

Despite all disparagement of systematic theology and doctrinal sermons, it remains true that there is no subject in which more people are deeply interested than in religious doctrine. No one need want an audience who can present truths concerning God and the spiritual life in forms consistent with the best knowledge and thought of these times. Dr. McColl has that ability, and a wide and cordial welcome may be predicted for his little essay. "A working theology," he says, "is a theology that works," one, that is to say, which closely touches life, confirms itself in experience, and issues in power. Its keynotes are reverence and reality." These characteristics are manifest in his luminous treatment of such timely themes as "Prayer in a World of Law," "Miracles in a Scientific Age," and "The Bible in the Light of Modern Revelation and Inspiration." Occasionally he lapses into some trite, but untenable dictum of the apologists, as when he says that the resurrection is "one of the best-attested facts of human history," and often one wishes that he would pursue his theme a little farther; for example, a discussion of the feeding of the five thousand or Christ's walking on the water would have been in place in the chapter on miracles; but perhaps in so brief an essay one ought not to expect more than suggestion, and in general the spirit is that of honest facing of difficulty. The volume is calculated to help many toward a "theology that will work."

Literary Notes

...A series of pamphlets is being issued by the Free Public Library of Newark, N. J., on the use of the library by the schools. Each course is divided into lessons with detailed instructions in the finding of books by the index and looking up the literature of a subject. Numerous practical exercises are given with the regular cards and forms.

...We need do no more than again call attention to the rapid successive appearance of the Schaff-Herzog Encyclopedia of Religious Knowledge, published by the Funk & Wagnalls Company. The third volume nearly finishes the letter D. It is admirably edited, compact and yet full, and the list of articles is as nearly complete as can well be made. We commend it heartily.

...Mr. Isidor Singer bids fair to be the great encyclopedist. First he projected the great "Jewish Encyclopedia" of twelve volumes, published by Funk & Wagnalls, and he now has in hand a similar Encyclopedia of Insurance. But before that is completed he proposes, and will probably achieve, a twelve volume encyclopedic "History of the Jews in Monograph," to be written by rabbis and to cover the history of the Jews of the world. Yet another plan well presented anticipates an encyclopedia of the Asiatic and African continents in twenty volumes, which shall cover both Asia and Africa, ancient and modern, geographical, historical, archæological, religious, political and ethnological, and with 5,000 illustrations. He proposes that it be edited under the auspices of the American Oriental Society and take ten years to complete it. The scheme is a large one, and the prospect fascinating, reaching as it does from Jerusalem and Stamboul to Peking and Tokyo, from Siberia to Ceylon, from Alexandria to Cape Town, and in time from the Deluge and the Pyramids to the emergence of Japan and the Cape to Cairo Railway.

...Dr. Louis Adolphe Coerne enjoys the double distinction of being the first native American to have a grand opera of his composition performed in Europe ("Zenobia," at Bremen, Dec. 1st, 1905) and of being the first recipient of the degree of Ph. D. from Harvard University for special work in music. His thesis on *The Evolution of Modern Orchestration*, now published by the Macmillan Company, New York (\$3 net) fills a void in English musical literature. For, while there have been plenty of technical treatises on the art of writing orchestral music, strange as it may seem, this is, with the single exception of Lavoix's "Histoire de l'Instrumentation," written more than a quarter of a century ago, the only comprehensive history of orchestration yet produced. Dr. Coerne supplements his able and acceptable review of the growth of orchestration with nearly a hundred pages of illustrative excerpts from the works of the thirteen composers who have done most to advance the art of instrumental coloring: Monteverde, Scarlatti, Haydn, Mozart, Beethoven, Weber, Ber-

lioz, Mendelssohn, Wagner, Saint-Saëns, Tchaikovsky, Dvorák and Richard Strauss. The book is one which no musical library can afford to do without.

Pebbles

"WERE you badly stung by mosquitoes?"
"No, just a little bit."—*Yale Record*.

It's difficult at times to account for the bright sayings of some children, after hearing their parents talk.—*Lippincott's*.

It might be easier to attract the attention of Venus than Mars by use of mirrors.—*New Haven Palladium*.

THE Rev. Mr. Spicer had for three days enjoyed the telephone, which had been his last gift from an admiring parishioner. He had been using it immediately before going to church.

When the time came for him to announce the hymn he rose and with his usual impressive manner read the words. Then in a crisp, firm tone he said: "Let us all unite in hymn six, double o; sing three."—*Youth's Companion*.

FIRST GERMAN PROFESSOR—Would you believe it, my dear colleague, I actually do not know the ages of my children?

Second German Professor—Such a thing could never happen with me. I was born 2,300 years after Socrates; my wife 1,800 years after the death of Tiberius; our son, Leo, 2,000 years after the promulgation of the Licinian laws by Tiberius Sempronius Gracchus, and our Amanda 1,500 years after the commencement of the great Migration. Very simple, is it not?—*The Classical Review*.

IN referring to a thin boy, it is all right to call him "skinny," but you must call a thin girl "spirituelle." It means the same, but sounds better. Never call any one but a boy "puny." A "puny" girl should be called "fragile." It sounds more like delicate china, and all of that sex like to be compared to fine Dresden. A "chunky" boy is all right, but a girl has a "finely rounded figure." A boy is "gawky," but a girl displays "untutored grace."—*Atchison Globe*.

He traveled far thru many land,
He heard the Adriatic roar;
He walked on Egypt's burning sands
And stood where Cæsar stood of yore;
He viewed the Pyramids and Sphinx,
And when at last he had come home
He only talked about the drinks
They served in Cairo and in Rome.

She found her way to Ispahan,
She spent a week in Bay Bander,
And hurried onward thru Japan
And paused at Melbourne for a day
And, having reached her native shore,
Her only subject, first and last,
Concerned the clothes the women wore
Within the realms then which she bore.
—*Chicago Record-Herald*

The Independent

Entered at New York Post Office as Second Class Matter
PUBLISHED WEEKLY BY W. BOWEN
100 Fulton Street New York

A WEEKLY MAGAZINE FOUNDED IN 1848

One Year, \$2.00 Single Copies, 10 cents

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for one year in advance, and clubbing rates will be granted as low as offered by any publisher.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free of application. Next January, binding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve copies.

Advertising rates will be furnished on application.

The Disintegration of Parties

WHEN political parties have become disorganized, broken into sections with conflicting views, we may look for approaching reconstruction, or at least realignment. Such is the condition of both the Republican and the Democratic parties today. It is time for a change.

Look at it. What principles do the two parties represent in any such way as to distinguish them? There were definite economical issues that separated them before the Civil War, and certain moral and constitutional issues that divided them during that war. But after the Civil War and the passing of the Reconstruction period, there arose the prime necessity to enlarge the national revenue, and the Republican party took up the old Whig doctrine of Protection, with its high tariffs, and forgot its earlier principles. Meanwhile the Democratic doctrine of Free Trade became less pronounced, under the necessities of revenue, and could not be recovered even under the leadership of Grover Cleveland. There grew up, under Protection, gigantic combinations of wealth which introduced new conditions and exigent political problems. What followed is the disintegration of parties which we now behold.

See the party of Protection, divided in Congress into stand-patters and insurgents, both using the old shibboleth, but one seeking a high and the other a low tariff. Think of the manufacturing State of Massachusetts demanding free hides and free coal. Then see the party of Free Trade split into sections; Democrats in the Senate standing pat with Republicans for protection of sugar and lumber; sections of the opposing parties combining with each other to carry their various interests. It is an amazing phenomenon, utterly subversive of all party consistency. Is La Follette a Republican? Is Daniel a Democrat?

Then there is the question of finance and the control of corporate interests, the one other great public question. See how the two parties are divided. Have we not seen Cleveland and Bryan, both Democrats, and yet representing opposite financial views? Do the Democrats of New York and those of Texas represent the same principles as to the control of corporations? Or, in the Republican party, did not Roosevelt represent a view praised by as many Democrats as Republicans, and curst by men of both parties?

The condition is very curious and quite abnormal. It reminds one of the political condition before the Civil War, when the Whig party was breaking up, and Democrats and Whigs were flocking into the Free Soil party. There is no sort of reason in the present condition. We are held together by old names and traditions that have lost their meaning. All signs look to reconstruction of parties along the lines that have already divided each of the old parties. It is nearly or quite time to divide on principles, and not on power and plunder. Who is a Republican here in the North? Who is a Democrat in the South?

The Side-Shows and the Main Tent

THE commencement season has always been an occasion for fault finding, but there has been a change in its objective. Formerly, when the graduating class were permitted to hold forth, they directed their attacks upon the outside world. Nowadays, when the collegiate authorities monopolize the platform, they criticise the students. Being critics

by profession and in a position to discover the weak points of their subjects, they are able to make very clear the need of a reform in collegiate life, altho they are not so unanimous and definite as to the manner of the reformation.

This year most of the commencement criticism is directed at what is undeniably the most vulnerable point in our collegiate system, that is, the diversion of the interests of the student body from the true aims of the college. Social life, athletics, dissipation and the multitude of other student activities have cut down to the minimum the attention given to their studies. President Wilson, of Princeton, in his Concord speech last week, explained the situation with characteristic frankness and lucidity:

"So far as the colleges go, the sideshows have swallowed up the circus and we in the main tent do not know what is going on. And I do not know that I want to continue under those conditions as a ring-master. There are more honest occupations than teaching if you cannot teach.

"I believe in athletics. I believe in all those things which relax energy, that the faculties may be at their best when the energies are not relaxed, but only so far do I believe in these diversions. When the lad leaves school he should cease to be an athlete. The modern world is an exacting one and the things it exacts are mostly intellectual."

Now, students have never given as much attention to their books as their instructors think they should, and there is no reason for expecting that they ever will. But it is possible to have such an atmosphere in a university that the students will have scholarly interests, will prize scholarly honors, and will cultivate scholarly diversions. Such an atmosphere has been maintained in many places and for long periods, and it is not unreasonable to hope that it may be re-established in our American universities. President Lowell, of Harvard, in his Phi Beta Kappa address at Columbia last week, called attention to the fact that in England the competitive honors of the universities have a value even in the outside world:

"We need more than a minimum requirement to get men of ability; there must be an external stimulus. And yet the college today is the place where that stimulus is applied least. By the free use of competition athletics has beaten scholarship out of sight in the estimation of the community at large and in the regard of the college student bodies. Should

faculties not take advantage of a similar stimulus? In the English universities the now established system of honors and pass examinations has the result of bringing before the public the acquisition of such distinctions so that they are referred to nearly as much as are athletic feats in this country.

"Competition as a means of power suffers from the students' idea that we are employing tests of industry alone and not those of intellectual superiority. We should employ tests that will measure not merely diligence but those which will measure the amount of intellectual power. On the new standard of shunning individualism the scholar seems to be striving for a personal distinction, but the member of the football team stands out worthy of praise as a college hero because of his devotion to the interests of his alma mater, or rather to those of his fellow students. It is a sort of co-operative selfishness."

President Lowell's remarks are of special weight, for it is natural and probably not unjust to assume that they are in some degree indicative of his intended policy at Harvard. It is, therefore, interesting to see that he does not seem averse to the introduction of the competitive motive into the field of scholarship, from which it was not many years ago expelled with contumely. The professors, it appears, are to take lessons from the coaches.

Some such extraneous incentive certainly seems to be necessary, for the pure joy of intellectual achievement does not compare as an inducement to exertion with the greater glory of banners and bands and newspaper headlines. Phi Beta Kappa is not a noticeable stimulus and Sigma Xi, its equivalent on the scientific side, has even less prestige.

If we are to have intercollegiate contests in intellectualism, what form will they take? Will there be public disputations, in the style of the schoolmen? Will the two sides alternately propound to each other mathematical puzzles and logical subtleties? Will the Association of American Universities prescribe the rules and the Carnegie Foundation and General Education Board offer the prizes? And will the public take the same interest in the contest that they now take in baseball?

Let us suppose that the new *regime* of intellectual competition is in effect now, and Columbia and Cornell are matching their dissertations. In New York City, Park Row is packed with upturned

faces watching the bulletin boards. Clerks and their employers hurrying home have stopped to get the returns. Bootblacks and messenger boys, sitting in a row on the fences, have staked their last nickels. The stockbroker nudges the man with a dinner pail and asks him for the score. On the blackboard in front of the newspaper office appears the announcement that Dr. Kropff, of Columbia, has prepared some new derivatives of diaminoisophthalic acid. Cornell counters with Dr. Ray's triazo-compounds of resorcin. Then Columbia scores with Dr. Tripp's dissertation on "Groups of order $p^3 q^2$," followed by Dr. Mead's on "The chondrocranium of an embryo pig, *sus scrofa*." That part of the crowd which has its money on Cornell looks gloomy, but recovers when the markers chalk down Dr. Ventura's "Catalan Phonetics" and Dr. Carney's "Pleistocene Geology of the Moravian Quadrangle." A shout from a thousand throats is heard when the street sees that Dr. Haas has translated the *Dasarupa* of Dhanamjaya, until the applause is checked by the announcement of Dr. McKelvey's study of the groups of birational transformations of algebraic curves of Genus 5. His curves seem to baffle Columbia for a moment, but Dr. Parmelee, formerly of Yale, comes to the rescue with his dissertation on "Inebriety in Boston." So the contest goes on hour by hour, while the popular excitement grows more intense, and extras of the yellow journals, with portraits of the winning men and explanatory diagrams of their theses, spread the news to the suburbs. The real heroes of the university thus receive the honor that is their due, and the athletic student must get his gratification from the pure joy of exercise.

Liberty, Equality and Fraternity Limited

THE designation of this old firm has been changed since it was organized at the time of the American and French Revolutions. It is now "Limited," which means that the partners have concluded to limit their responsibility and scope. Hereafter their service will be confined to people of their own sort; they will ac-

knowledge and pay no debts to any not of their own race or family.

We had thought the field of the firm was unlimited, that its appeal was to all. But now we hear those who talk the loudest about democracy, even extreme Socialists, insist that liberty, equality and fraternity are only for those who are equal, not so for the inferior races; the yellow and black people are left out. They are not equal to us.

We think it was the discovery of the spread of this teaching of limited equality, limited democracy, that was the occasion for the calling last week in this city of an important conference, for the purpose of emphasizing the wider doctrine of the two Revolutions and of the Civil War. The conference was not called by the elder friends of universal liberty, but by some of the younger men and women, led by Mr. William E. Walling, who had come to observe the prevalence of the limiting doctrine and to notice its effective shutting the gates of opportunity against those of the discredited color. It is well that such a new generation of idealists of freedom should arise to hold the succession of those who inherit the fervor of the Declaration of Independence and the Emancipation Proclamation.

The resolutions adopted by the conference were simple and primary enough, to the effect, merely, that the growing denial of equal rights to ten millions of our fellow citizens is the greatest menace that threatens our country; that their disfranchisement is a peril to both races; that professional and academic education for the more gifted is no less important than industrial education for the mass; that equal privileges in the legislature and in law should be given the negro; that the denial to black men, even by violence, of equal right to work, as in this Georgia strike, is a shameful offense; that the national Government should strictly enforce the civil rights constitutionally given to all; that everywhere the public school expenditure should be the same for those of different races; that everywhere the negro's right to the ballot be equally recognized; and that any policy excluding the negro from public office in the South is to be condemned.

This is all admirable in principle, and we can only seek to carry it out by correcting public sentiment everywhere. It is a campaign of education that is needed, a new emphasis put on the doctrine that all men are created equal; not in individual capacity, to be sure, but in the rights to attainment as well as to protection. It is a fine thing to have the younger champions of equal opportunity join together, the two races, to renew adhesion to the old doctrine, and to denounce the growing limitation of liberty, equality and fraternity.

While there has been in so many quarters in the North a growing indifference to the doctrine of equal human rights, there have continued to be those who have not allowed their zeal to cool, and who have determined that, so far as they could achieve it, the opportunity for the negro to rise should not be denied. It is these friends from the North that have provided all the best schools that have educated the negro teachers. This has not been done by the South. Even in the lower education of the primary school, the negro pays by taxation for all he gets; and in some States his share of taxation helps pay for white education also. Of the amount of money given by Northern friends year by year for the uplift of the negro during these forty-five years there is no record. Far the larger part of it has been gathered and expended by a dozen missionary organizations, mostly for education, partly for churches. Nearly all the leading negro colleges in the South, and the multitude of normal schools, were founded and are generally still supported by them. Such are Fisk and Atlanta among those of the first rank, which have supplied nearly all the present leaders of the race; while, of those which put industrial education to the fore, Hampton and Tuskegee have gained their support from the same constituency. The financial reports of five of our missionary societies, Congregational, Presbyterian, Baptist, Methodist and Episcopal (in the order of their gifts) show that they contributed last year \$775,000 for the uplift of the negroes of the South. We should probably have to add nearly or quite as much more for other benefactions. Three such independent schools — Atlanta,

Hampton and Tuskegee — received over \$400,000 last year. If we put the total amount at only a million and a quarter — and we believe it to be more — that represents, at 5 per cent., a capital of twenty-one and a half million dollars invested in the love and faith of benevolent people for a needy but aspiring race. It represents, tho slightly, the sense of obligation under which we have lain to repair the dreadful wrongs we have done to the freedmen. But we need fresh impulse for justice, fresh denunciation of the limitation of the breadth of freedom for which our fathers fought, and we rejoice in such a conference as this of last week; for there is no other wrong and no other national peril so great as this, which concerns the present and future of ten millions of our citizens.

The Aldrich Tariff Revision

At the end of last week the Senate voted upon the Aldrich bill's increases of the duties on cotton goods. These increases had been attacked with much force and persistence by the Republican critics of the Aldrich revision. Mr. Dooliver began the work some time ago, before the cotton goods schedule had been taken up. It was renewed last week by himself and others, and a very notable contribution to the debate was made by Mr. La Follette, who laid bare the disguised and unwarrantable additions to the Dingley duties, item by item, using official figures and statements, and showing a long list of increases, running up to 110 per cent., upon goods the importation of which is virtually prohibited even by the present rates.

That is to say, where the increase is 110 per cent., the imports last year were only \$8,109, and where Mr. Aldrich proposes an addition of 98 per cent., the present duty permitted only \$7,000 worth of goods to come in from abroad. And, in one exceptional instance, the official statement indicated an increase of 460 per cent., designed to check an incoming flood represented by imports last year of \$5,000! Of course, such additions are not to be made for protection. Surely, there is ample protection in the present duties. But such increases would enable combined domes-

tic manufacturers to raise prices. Attack and exposure were made in vain. The provisions of the bill were approved. On every motion Mr. Aldrich had a majority of from 9 to 11, and the opposition of 10 Republicans was easily overcome. This was regarded as a conclusive test of the "insurgent" strength, and now it is admitted that the bill will be passed in the form desired by the Aldrich majority. Those duties which have been withheld so long, for trading purposes or to keep uncertain men in line, will soon be brought forward and approved, together with the provisions for a costly and unnecessary Customs Court and the extraordinary maximum rates, which, if enacted, will add 25 per cent., for a time, at least, to the duties upon a considerable part of our imports, in some instances more than doubling the ordinary duties of the bill. It should not be forgotten that these maximum rates would, so far as they should be used, give 25 per cent. more protection to domestic manufacturers and combinations of manufacturers.

As for the conference committee, to which it is said that Mr. Taft looks for relief, we venture to say that part of its work is already done. Does any one think that the names of its members have not for some time past been known to Senator Aldrich and Speaker Cannon?

Will the country be satisfied with such a bill as, in all probability, is soon to be passed and sent to the President? We think not. The fact should not be overlooked that the character of the bill has been thoroly exposed by Republicans, not by Democrats, whose arguments and attacks have little or no weight with the average Republican partisan. The unwarrantable increases, open or hidden, have been pointed out and denounced by men of exceptional ability and force, who are not only Republicans, but also protectionists. As a rule, they are willing to accept the present Dingley duties. They attack additions to those duties, and their work has been well done. We believe that a majority of their Republican constituents think that even the Dingley rates are too high. At all events these constituents, and probably a majority of the Republicans in the States of

other Republican Senators, cannot fail to be impressed by the facts which Republicans in the Senate have brought to light and emphasized for the consideration of the public.

"The main point," said Secretary MacVeagh at Chicago last Saturday, "is to satisfy the people of the Middle West. If they are not satisfied, then the tariff question will unfortunately not be out of the way and we shall not have rest." Now, the people of the Middle West are those who are represented in the Senate by the Republican "insurgents," by Mr. Dolliver, Mr. La Follette, Mr. Cummins, Mr. Bristow, Mr. Nelson and their associates, who vote against Mr. Aldrich. Of course, they will not be satisfied by the enactment of the provisions which these gentlemen are so sharply denouncing. If the Secretary is right, tariff revision will be a lively and troublesome issue after the enactment of such a revision as the one which Congress now proposes to make. We assume that there will be no veto, for the substance of many opinions sent from Washington is that, while the President does not like either the House bill or the Senate bill, he is not at present inclined to withhold his formal approval of the bill finally agreed upon.

Congress had an opportunity to settle the tariff question for a considerable time by a just revision. Unfortunately it is probably about to take action that will promote continued agitation. We should not regard as a statute of ideal excellence a tariff law framed honestly in accord with the doctrine of last year's Republican platform, but such a law—which would differ very widely from either the Payne bill or the Aldrich bill—would probably satisfy the Middle West and prevent further general revision for ten years to come.

Constructive Socialism

No one better than the Socialist himself knows that it is easier to expose the wastefulness and the injustice of the existing social order than it is to predict just what a socialistic social system would do. Not a few of us who find socialism interesting, and Socialists, as human beings, still more interesting, find ourselves quite "absorbed in the story"

so long as we are reading a good Marxian analysis of capitalism, or a Fabian essay on the iniquities of rent. But when we follow up the stirring tale with stories "by the same authors" of what is going to happen by and by, we become conscious of that "let down feeling" which we had when we took up "Twenty Years After" while still tingling with the delicious sensations awakened by the "Three Musketeers."

However, we must acknowledge that reserve and understatement in describing the industrial society of the good time coming are not faults. The more influential "intellectuals" of the Socialist movement are not in love with that picture of a socialistic state which was limned by Edward Bellamy, or even with the more modest prospectus set forth in Laurence Gronlund's "Co-operative Commonwealth." Whatever else may be said of the Socialist's intellectual and moral shortcomings—if he has any—he at least does not exploit the arts or talk the language of the promotor.

To this extent the Socialist is hard-headed, as well as soft-hearted, and this element of good sense in him comes out rather conspicuously in his replies to certain questions which the editor of *The Saturday Evening Post*, of Philadelphia, has just now been putting to him. The questions submitted were: "First, How will the co-operative commonwealth be brought about?" and second, "Suppose that you should elect a Socialist President and Congress, how would you go about transferring private property to public ownership?" Answers are printed from Eugene V. Debs, Victor Berger, Gaylord Wilshire, Upton Sinclair, Bernard Berlyn, John C. Chase, some time Socialist Mayor of Haverhill, Mass.; William Mailly, editor of the *New York Call*; Robert Hunter, and A. M. Simons, editor of the *Chicago Daily Socialist*. These contributions are printed under the heading, "Practical Socialism, Is There Any Such Thing?" Perhaps there isn't any such thing, but these writers evince a rather practical way of viewing the possibility.

To begin with, they betray a feeling that the questions submitted to them are academic, and not quite of the sort that would be asked by any one familiar with

socialistic literature. Figuratively speaking, they smile at the second question. Evidently, it has struck them very much like the question, Do you think that you could salt the bird's tail, if you once caught him? Seriously, they don't expect to elect a President and Congress right away; and before they get that far, a greater part of the socialistic program will have been put in operation, most of them believe. On this point Upton Sinclair is drily specific. When the country has once made it clear that it means to have socialism, he observes, the Republican party will supply the article. And Gaylord Wilshire says:

"I don't think we're ever going to elect a President or a Congress or anything. . . . The dominant political party, whatever it may be, will be forced by the logic of events toward the Socialist program, forced so far toward it that the dominant political party will carry it out unawares."

These remarks have a curiously opportunistic sound. It is indeed the opportunistic note that is dominant in all of these forecasts. Victor Berger especially exalts the evolutionary kind of socialism, and pays his compliments to the militant or revolutionary brethren by characterizing them as "our Socialist impossibilists." How ineffective would be a socialistic *régime* ushered in by revolution he shows in this telling paragraph:

"France in the Revolution tried to do the very thing which you suggest. Between the 4th and 15th of August, 1789, she abolished feudalism, all titles of nobility and the State Church. A few years later she abolished a Supreme Being; and she confiscated all the lands of the nobility and the Church. Yet France has since had three different revolutions, two different empires, two different kingdoms and three republics. A few years ago the nobility, the clergy, and the anti-Dreyfusards tried to re-establish a monarchy, and only the demonstration of two hundred thousand Socialists stopped it. France is now shaken from top to bottom by the attempt to get rid of a State Church—and all this happened one hundred years after feudalism and the Church were officially abolished forever in France."

If any unfeeling "capitalist" or "retainer" has stated the brutal truth of history more bluntly than this, we haven't happened on the passage.

Almost as noteworthy as the opportunism of these socialistic leaders is their boldly businesslike conception of what the co-operative commonwealth would do. It wouldn't stop a wheel, they say,

on most a thing, and a busy population would be as unconscious of what was happening as trainmen and trackwalkers are when the ownership of a railroad changes hands in the stock market. The people, instead of the millionaires, would own the big industries, the railroads and the natural resources. They would have come into possession of them quietly by purchase and taxation. There would be no creation of a gigantic bureaucracy. The Government would appoint boards of directors, as it now appoints receivers, and these directors would manage business, or get it managed, just as directors do now.

Whether or not this kind of socialism is practical seems not to concern our "intellectuals" very much either. They are indeed so non-militant that they don't even expect themselves to bring about the new order of things. They agree with Karl Marx that the capitalists in their own way will do the job without much extraneous help.

We hardly know what the "really truly" militant Socialists will say to all this when their turn comes. We are afraid they will call these opportunist fellows mere drawing-room celebrities.

Italy and the Triple Alliance

"UNALTERABLE friendship" was the telegraphic declaration of the two German Emperors, Hapsburg and Hohenzollern, from Vienna to Rome. A smile must have spread not only over the Quirinal and the Peninsula, but even thru the Vatican. At this moment, Germany is taking repressive measures against Italian wines; and in its proposed insurance and pensions for workingmen, the Reichstag has special safeguards against those from beyond the Alps.

In its turn, Austria refuses to solve the question of an Italian university in accord with the wishes of its Italian subjects, who want it at Trieste, but intends to put it at Innsbruck or some other place beyond Italian influence. In the same spirit it refuses to recognize the rights of the Italian language in Dalmatia, which runs parallel to Italy on the east coast of the Adriatic, where from time immemorial the Italians have enjoyed certain rights. Moreover the Hapsburg

Empire is building four Dreadnoughts, which can sail in no Austrian waters save the dividing Adriatic. Lastly the Emperor, Francis Joseph, is the only ruler in Europe who will not send a representative to Rome in 1911 to celebrate the Golden Jubilee of the Eternal City as the Capital of Italy. Of course this refusal is in dread of the Vatican, whose former activity in stirring up troubles in Hungary while Rampolla was Papal Secretary will never be forgotten or forgiven by Austria.

No doubt the Vatican enjoyed the joint-Vatican despatch; so does the Italian Government, which meanwhile is having four Dreadnoughts built. In this political chessboard little fear need be felt for the Pope's countrymen. They have long been good politicians; smart enough to retain control of the Church in spite of Hohenstauffen and Valois; clever enough also to watch the German armies from Charlemagne's days onward waste away in the Campagna Romana. For those Northern barbarians ever turned wistful eyes to the sunny peninsula but in vain. True, Austria got a foothold, chiefly because of Napoleon's fall, but Hapsburg stupidity hectored a people who knew not how to be conquered, till, recalling their ancient glories, the Italians chased the detested white uniforms into the Lago di Garda and the moors of Venezia. And Italy smiles at the Triple Alliance beyond the Alps and also at the Triple Understanding on the side of the sea, Germany, Austria, Italy, versus England, France and Italy. A more natural because more racial affinity would be Germany, Austria and England versus France and Italy with the Iberian Peninsula; the Monarchical versus the Republican races. For as things now look the hopes of republicanism lie with the Latin races.

Does Prohibition Prohibit?

This is one of the questions in which the American people are now vitally interested and this is the question on which we now ask the testimony of our readers. For our "experience meeting" on woman suffrage of May 20 we received a large number of interesting and pertinent letters and we should have more on this subject because

more people know something about it. Half the population and much more than half the area of the United States are under the prohibition *régime*, in some of its forms, State, local or Federal. And we also want letters for comparison from those who are living in the "wet" territory as to the way such liquor laws as they have are enforced and effective. Send in letters of three or four hundred words, pointed, personal and specific, telling what you know about the advantages or disadvantages of prohibition and local option; not how you think it ought to work, but how it does work. Would you advise other localities to adopt the policy? Why or why not? Have you ever had the opportunity to compare a town before and after abolishing the saloon or a "dry" town with a "wet" one? What is the difference? How many of the blessings promised by the prohibitionists and how many of the evils predicted by the antis are actually realized? We will publish these letters shortly after July 1st, and they should be written and mailed immediately.

A Fleet for Canada

What happens to the snake when he develops poison glands, lifts his head, coils for a spring and rattles his tail, all in self-defense? He is hunted on all sides until exterminated. The nations of the world are creating mightier navies, all in self-defense. Canada now offers to build eight cruisers and twenty torpedo boats, not to be added directly to the British navy, but to be manned by Canadian seamen and kept in Canadian waters, to protect the entrance to the St. Lawrence River and to be available for Imperial service in case of war. That interests us. We have had two wars with Great Britain, and one more just escaped because we were too busy to attend to it, not to speak of a smart clash later over Venezuela. Now, we do not want war with Great Britain, do not believe there will be any, but this plan does not look pacific. The Irishman's admiration of a stout blackthorn as "an elegant peacemaker" does not conduce to quiet at a Tipperary May-fair. Peace is good, but there are better and cheaper ways for Canada to secure peace than by

expending an initial \$25,000,000 on a fleet, and then no man knows how much more annually to keep it in commission and support its idle crews. But Canada thinks she must not fall behind younger rival loyalty, and we are just as bad ourselves.

Melody and Harmony in Poetry

In a very interesting series of letters addressed to the late Edmund C. Stedman and just published the poet Swinburne criticises American poetry as being little more than versified prose. He says that Bryant's "Thanatopsis" is "a most august meditation," and Lowell's "Commemoration Ode" is "a noble expression of deep and grave patriotic feeling on a supreme national occasion"; but he adds:

"I cannot say that either of them leaves in my ear the echo of a single note of song. It is excellent and good speech, but if given to us as song its first and last duty is to sing."

That depends. Poetry does not need to be always lyrical. The thought is more than the lilt, the words more than the music. "It is a poor thing," says Swinburne, "to have nothing but melody and to be unable to rise above it into harmony." That sentence would deserve discussion in a long essay. By melody we suppose he means the mere, simple metrical structure of verse, while by harmony he means the accessories that give added beauty of expression, of which rhyme is the most obvious and cheapest. He says that Whittier is admirable for power, pathos and righteousness, but is "deplorably ready to put up with the first word, good or bad, that comes to hand." There is some justice in the criticism, and he is right in asking, "In the name of all bagpipes, what is the tune of Emerson's?" Swinburne erred in putting first that which should have been last, the polish before the structure. The harmony, the rhyme, the alliteration, the syzygy of vowel and consonant are fine, most fascinating for completeness, and the melody of perfect but varying meter is most choice; but back of both, giving permanence in spite of defects in both melody and harmony, is that merit which reaches beyond the ear into the brain and satisfies the intellect.

The Partition in Persia

The partition of Turkey has probably stopped, and that of Persia is probably at hand. Turkey was nearer to Western influences, and her statesmen had the ability to avoid by reforms the otherwise inevitable. Not so with Persia. Some time ago Russia and Great Britain agreed as to their spheres of influence over two-thirds of the country, and now it is most plausibly asserted that in a more definite way they have agreed to control the whole country. Of course the Governments of the three countries will not confess it, but the former step seems to imply the latter. The two Powers, so it is asserted, will support the Shah and restore the Constitution and protect against all violence. They will control the financial affairs of Persia and give consent and all concessions. This, if true, makes Persia a dependency, like Egypt. To be sure there is danger of differences arising between Great Britain and Russia over their rule, just as there was in the case of Egypt before Great Britain became sole ruler; but that fact only assures the speedier division of the prey, and its complete absorption by the two Christian nations. The ethics of it all is in the necessity of securing peace. If we had an international parliament this is very nearly what would be done by international law instead of by the primitive law of grab.

In an address accompanying the report of the Presbyterian Board of Education made to the Assembly at Denver, Dr. Joseph W. Cochran, its secretary, explained thus in part the lack of candidates for the ministry:

"Does he go for his education to a Christian school? He goes to a godless State university, and when he returns to his home town he puts religion at a low ebb. We cannot Christianize these State universities, but we can put a shepherd in charge, and in this way keep these boys in the flock."

Such language is slanderous and false. The State universities are no more godless than is Princeton University or any other Presbyterian college. There is as much religion in the State University of Michigan as in any other university in the country. Dr. Angell is the University of Minnesota, of which the Rev. Dr. Northrup has been president for twenty-

five years, as in Macalester and Westminster colleges, which are Presbyterian. A statement like the above is one that ought not to have been made.

The legal condition of an Established Church is set forth with great clearness in the decision of the King's Bench, in a case where holy communion had been refused a man because he had married his deceased wife's sister in Canada, where it was lawful before it had become lawful in 1907 in Great Britain. The court supported the man's right to communion, beginning with this declaration:

"I start with the fact that Canon Thompson is a parish priest of the Church of England, a reformed Church acknowledging the King as being in all causes, ecclesiastical as well as civil, within his dominions, supreme, and the King rules by and in accordance with statutes of the realm."

To make the lineal King supreme over the Church is worse than making the elected Pope supreme; and either is intolerable.

The Congregationalist shrewdly suggests that, as the moderators selected for the current year by the Northern and Southern General Assemblies are both ex-Confederate soldiers, they might do something to heal the long separation between the two bodies. We wish they might. All that nominally stands in the way is the fact that the Old School General Assembly, which went out of existence more than forty years ago thru union with the New School Assembly, voted during the Civil War to condemn secession, which was, it is charged, a political and not a religious pronouncement, and so unwarranted and never yet apologized for.

It is good news, if true, which the commission of the Porto Rican Republican party carries back from Washington. They report that President Taft will try to secure citizenship for the people of the island. We have often urged this duty on Congress. The people have lost citizenship in Spain, but have not gained it in the United States. They are in the air, like Mohammed's coffin. We are not surprised that after President Taft's express

dissatisfaction with the political conditions in Porto Rico he should have turned to the other party; but for any success there we must trust the people.

It has been sometimes suggested that instead of hanging murderers they should be segregated in a lone island somewhere and left to create their own social state. That is not feasible, but something of the sort is wisely done in New Zealand with drunkards. The little island of Pakatoa is far enough from Auckland to be a safe harbor where those convicted four times of drunkenness are sent, and where no intoxicating liquors are allowed admission. But why not make all New Zealand dry, and then there would be needed no "Drunkards' Island"?

It was thought worth while to cable to the American press last Sunday that the aeroplane is seriously disturbing European chancelleries with the fear that it may utterly revolutionize war. Half a dozen aeroplanes, says Captain Bulloch, could destroy London; and Mr. Stead writes a sensational article to the effect that airships will destroy the customs service and obliterate national frontiers. This is an old story to our readers, for we have more than once discussed the matter. An editorial in our issue of May 6th was on "Dreadnoughts and Airships."

We hear much of the lack of practical education in our old-fashioned colleges, but we expect the most practical in our military and naval schools. And yet, when the British fleet visited an Italian port and the city wished to show courtesies to the fleet, it was found that there was not a single officer from the admiral down who could talk Italian. And the First Lord of Admiralty stated in Parliament the other day that out of 4,716 officers in the navy, only twelve were competent to act as interpreters of German.

One day Prof. Burt G. Wilder was in his museum at Cornell University when he saw two visitors meet directly in front of a stuffed chimpanzee. One of them

was a crude prognathous negro, the other a crude prognathous Irishman. They looked at the big monkey and the Irishman pointed at it and then pointed to the negro; but the latter at the same moment and with a similar thought was raising his finger to point first at the case and then to the Irishman. Each thought the beast looked like the other man.

Here is a new Sunday argument which we commend to the attention of the public. The necessity of a Sabbath rest is not confined to the men and domestic animals included in the Fourth Commandment. Prof. Sir J. J. Thompson in a late lecture on the "Properties of Matter" spoke of "elastic fatigue" and illustrated it by means of vibrating wires. He said:

"Vibrating wires resemble human beings; after vibrating all the week they get tired on Saturday night, but if allowed to rest on Sunday they are refreshed by the holiday."

The surprise of the religious census in Harlem is that in over three thousand families, 67 per cent., two-thirds of all, have no relation with any synagog, while 26.5 per cent., a little over a quarter of the Protestant families, recognize no church home, and of the Roman Catholics only 9.2 per cent. If this condition continues, the Jewish people will in a generation or two lose their separate identity. The conditions are bad enough with the Protestants.

It is well to have strikes ended, but it is not well to have, as in the case of the Philadelphia trolley strike, this accomplished, not with a view to the benefit of the strikers, the companies or the city, but to maintain the supremacy of the ruling ring of a political party. A chief end to be sought by reform is the substitution of the rule of the people for that of the bosses.

The Kansas Supreme Court has decided that in the grades below the high school cities may separate white and colored children in different schools, if equally good. This may be constitutional, but it is a disgrace to Kansas.

The 4th of July Celebration

FOR some years we have doubted the expediency of celebrating the Fourth of July in the barbarous fashion that has so long obtained among us, and which costs so much in life, limb and property. We have felt that a safer and a saner Fourth of July celebration ought to come, and that such a celebration was even better calculated to revive and keep alive the memories of 1776. Those who manufacture fireworks and who have large capital invested in such enterprises will, of course, not be inclined to look with favor upon the taking away of its barbarous character from July 4th. Of course, the business of manufacturing pyrotechnics, in which from \$2,000,000 to \$3,000,000 of capital is doubtless invested, and which pays taxes and licenses amounting to thousands of dollars, besides furnishing employment to three or four thousand persons, ought to have some consideration. On the other hand, the grim record of last year ought to exercise a restraining if not a prohibitive influence upon the promiscuous use of fireworks, bombs, cannon crackers and the deadly toy pistol. Let us glance briefly at last year's record and see if we wish to repeat this year what we endured last year. In 1908, according to figures furnished by *The Aetna*, 5,623 persons were killed or seriously wounded as one result of our barbaric way of celebrating Independence Day. The total number of casualties exceeds by 1,200 the figures for the preceding year, even if the actual deaths, 163, fall one below that for 1907. The number of deaths from tetanus foots up 55, and from other causes 108. One mitigating circumstance appears, which is that, because of warnings and of preventive methods, the ratio of deaths among cases of Fourth of July tetanus shows a depressing tendency. Most of us know something regarding the details of the carnage wrought by the toy pistol and the firecracker scheme of marking the

celebration of our glorious Fourth. We do not realize until the figures confront us that 11 victims were totally blinded on July 4th, 1908, 93 persons each lost one eye, 57 persons lost a leg, an arm or a hand, and 184 lost one or more fingers. The 5,623 casualties to which previous reference has been made are 5,623 conclusive arguments that cry out in favor of a drastic revision of the old-time method of observing the midsummer holiday. They call loudly for restrictive legislation, for the elimination of gunpowder, for the substitution of real patriotism for noise and explosion, and for a campaign of reform and education. It is pleasant to be able to record that present indications are that this year will see more "safe and sane" Fourth of July celebrations in the various cities of these United States than ever before. Let us hope that the various regulations and ordinances now existing will be enforced so as to minimize the accident roll very considerably. Cleveland now has an anti-explosive law, passed since our last Fourth of July. A citizens' committee will work in Washington on a scheme to entertain the small boy in a less dangerous way and make for his weaning from the devil's inventions of former years. Albany is to be restricted, but will not entirely eliminate racket and maiming. That city will permit the use of small firecrackers from 6 a. m. to 12 m. Chicago, with its sickening memories of fire, goes much further and has served notice of a rigid enforcement of the law against high explosives and dangerous toys. Conservative Boston, still under the spell of Bunker Hill, will not follow in the footsteps of Chicago, and in that learned city, according to *The Advertiser*, the outlook for the day does not promise much difference from the worst features of recent years. Perhaps we may yet live to see a Fourth of July of which we may justly be proud, and which will not cause as much death and accident as a first-class battlefield.

The Independent

VOL. LXVI NEW YORK, THURSDAY, JUNE 17, 1909

No. 3159

Survey of the World

Tariff Duties in the Senate

Considerable progress was made with the tariff bill in the Senate last week, altho the Republican insurgents stoutly opposed the provisions which they could not approve. The debate was marked by much bitterness. On Monday, there were many sharp passages between the insurgents and Mr. Aldrich, the latter attempting to read them out of the party, and asserting that their arguments were like those of Democrats and free trade tariff reformers. In return he was accused of making combinations with Democrats and of promoting a perversion of the Republican doctrine of protection. Reference having been made to the speech of Secretary MacVeagh, Mr. Smith, of Michigan, declined to follow one who had recently been a Democrat. Nor would he accept, he added, the views of Secretary Dickinson, who was still a Democrat. The duties on wool and woolen goods were taken up on the 8th, and the provisions of the bill were attacked by Mr. Dolliver, Mr. La Follette and others. Whenever a test was made the committee was sustained by a majority of ten or more. An amendment proposed by Mr. Dolliver, limiting certain duties to 100 per cent., was lost, 32 to 43. All of Mr. La Follette's amendments were rejected in a bunch, by a vote of 32 to 44. At the end Mr. Cummins moved to recommit the schedule, with instructions that the committee report one in accordance with the Republican platform, making the duties equal to the difference in costs of production, plus a reasonable profit. This was rejected, 8 to 59. The affirmative votes were cast by Republican

insurgents. The schedule, as adopted, is substantially a re-enactment of the present Dingley duties. In the course of the discussion, Mr. La Follette asserted that if the tariff should not be revised downward, the work would soon have to be done over again. Mr. Aldrich said the people were not dissatisfied with the rates. Mr. Cummins replied that the great mass of consumers were dissatisfied and declared that Mr. Aldrich was subjecting the Republican party to unmeasured criticism, unlimited ridicule, and, eventually, to inevitable defeat. Mr. La Follette's remarks about Mr. Aldrich's methods became so sharply personal that he was called to order. He pointed out that Mr. Penrose had not been disciplined for questioning his veracity. On Saturday the free list was taken up, and the provisions for the free admission of paintings and collections of art objects under an age limitation were adopted, 53 to 14, those in the negative holding that the duties were needed for revenue or that rich collectors should be taxed.—It became known early in the week that a new alliance of the Republican and the Democratic advocates of an income tax had been formed, and that a majority for such a tax was claimed with much confidence. Seventeen Republicans, it was said, would vote for it. Mr. Bailey had agreed to accept Mr. Cummins's amendments. These would make the tax 2 per cent. on all incomes over \$5,000. Whereupon Mr. Aldrich and his associates sought for a special tax with which the strength of this alliance might be impaired, and decided, it is said, to propose a tax upon the dividends or upon the net

earnings of corporations. In this they are said to have the support of Mr. Taft. It is understood that an inheritance tax cannot be passed. On the 11th, action upon an income tax was deferred one week by a vote of 45 to 33. The need of revenue in addition to that which the tariff will supply is said to be seen clearly by the President as well as by the supporters of the pending bill.

The East Room of the White House was full of distinguished persons when, on the 10th, President Taft presented to Wilbur and Orville Wright the gold medals awarded to them by the Aero Club of America. He was glad, he said, to show—perhaps at a delayed hour—that in America it was not true that a prophet was not without honor save in his own country:

"You made this discovery by a course that we of America like to feel is distinctively American—by keeping your noses right at the job until you had accomplished what you had determined to do. It has been said that this is the first Presidential recognition of aeronautics since President Washington. Well, all I have to say is, that I had a predecessor who, if aeronautics had proceeded as far when he left office as they have today, would not only have gone down under water in a submarine boat, but would have gone up into the air in a flying machine. No one had a more earnest interest, a more active interest, and a greater desire to see into the things that make for progress than my predecessor. There may be some reasons why some Presidents have not figured in aeronautics. I see that these gentlemen who have flown in the air are constructed more on the plan of birds than some of us."

He spoke for some time in a humorous vein, and in conclusion congratulated the brothers upon their maintenance, while receiving honors from crowned heads, of the modest and dignified demeanor worthy of American citizenship. Trials of their aeroplane are soon to be made at Fort Myer.—The President made an address on the evening of the 10th before the Congress of Roman Catholic Missionaries then in session in Washington, speaking principally of the settlement in the Philippines of difficulties caused by the close relation there of the Church to the Government. Separation would, he thought, strengthen the Church there

"as freedom and toleration and complete separation of Church and State have strengthened the Church in this country." Having spoken of his visit to Pope Leo XIII, to which "few extremists" had made objection, he added:

"I venture to say that if this visit to Rome had occurred forty years ago it would have sunk any Administration responsible for it; which only goes to show that this country is broad enough for all denominations to work together for the fatherhood of God and the brotherhood of man and for all of us to live here as American citizens, and that we should make no invidious distinctions in elections because of religious belief."

—Mr. Metcalfe, editor of Mr. Bryan's *Commoner*, says that Mr. Bryan will be a candidate in Nebraska for the Senate, to succeed Senator Burkett, Republican, whose term will expire in 1911.—Frank Cazalas, sheriff of Mobile County, Ala., has been impeached by the Supreme Court of that State for failing to take precautions to prevent the lynching of Richard Robertson, a negro, who was taken from the Mobile jail in January last and hanged by a mob. Cazalas will be removed from office.—In Portland, Ore., ex-District Attorney J. H. Hall, who was removed from office for failure to prosecute diligently the land fraud cases in which Senator Mitchell was involved, has been sentenced to serve sixty days in jail and pay a fine of \$1,000 for conspiracy to rob the Government in connection with land frauds.—Leo F. McCullough, president of the Boston Common Council last year, has been sentenced to serve two years at hard labor in prison for conspiracy to defraud the city by the use of false orders for the purchase of books. James T. Cassidy, a lawyer, who conspired with him, was sent to prison for one year. The sum involved was \$200.—In Goldfield, Nev., United States Senator Oliver, of Pennsylvania, and other directors or officers of a local mining company, have been indicted for conspiring, as alleged, to defraud Nevada of a bullion tax. Mr. Oliver has explained in the Senate that he had no knowledge of the details of the management of the mining property, and that the local managers had been guided by the advice of one of the most eminent law firms in Nevada.

The Sugar Trust Again

At the beginning of last week there was on trial in New York, before Judge Holt, of the United States District Court, the suit of the Pennsylvania Sugar Refining Company against the American Sugar Refining Company (the Sugar Trust) for \$30,000,000 damages. On the 8th, in the midst of the proceedings, a settlement was reached out of court, the Sugar Trust paying to the plaintiff a sum reported to have been more than \$3,000,000. In 1903, the new sugar refinery of the plaintiff company in Philadelphia was built by Adolph Segal, a wealthy real estate operator. It was a model of its kind and the purpose of Segal and his company was to use it in competition with the Trust. Before it could be so used he became financially embarrassed and was in need of a large loan. The money required, \$1,250,000, was offered to him by one Kissell, a broker, who was not known to be connected with the Trust. As the security included a majority of the sugar company's stock, Kissell imposed the condition that he should name the company's directors so long as the loan should remain unpaid. It soon appeared that he had been acting for the Trust, for the directors named by him represented the Trust and voted to keep the new refinery closed, and it has not yet been opened. The depreciation of this company's securities was one of the causes of the failure of the Real Estate Trust Company, of Philadelphia, whose president, Frank Hipple, committed suicide. This suit against the Trust was brought under the Sherman Act, in the name of the Sugar company, but really by George H. Earle, Jr., receiver of the Real Estate Trust Company, which is largely interested in the sugar company's securities. The settlement is generally regarded as a confession of guilt by the Sugar Trust. While no official statement has been made, it is understood that the Sugar Trust paid \$2,000,000 in cash and canceled the loan of \$1,250,000, returning the securities upon which it was based. As violation of the Sherman Act appears to have been admitted, the question is asked why the Government, in response to Mr. Earle's application, did not sue the Sugar Trust. The correspondence

relating to this matter has been published. Mr. Bonaparte, formerly Attorney-General, says that Mr. Earle offered to him no evidence that the controversy "involved the public interest." President Taft has directed the Department of Justice to ascertain whether the evidence produced in the suit and the circumstances attending the settlement call for the prosecution of the Trust by the Government.—The special commissioner of the Kansas Supreme Court reports, with respect to the ouster suit against the International Harvester Company, that the company has violated the State's Anti-Trust law and failed to pay its charter fee. This means that the company must change its methods and pay \$60,000, or go out of business.

Japanese Indicted in Hawaii

The strike of about 8,000 Japanese laborers employed on the Hawaiian sugar plantations began more than a month ago and is the most extensive disturbance of the kind ever known in the islands. A search made by the authorities in the offices of the Japanese newspaper and of the Higher Wage Association, on the 11th, brought to light letters and documents which were regarded as evidence that the Japanese strikers were conspiring to obtain control of Hawaiian affairs. On the following day seventeen of the strike leaders were indicted for conspiring to incite disorder. One of the seized letters which were laid before the grand jury was as follows:

"The Japanese strikers are facing the planters with enough powder, lead and food to make victory sure in the end. Now is the time to exalt the name of your nation and tint with blood the flag of the Rising Sun. Against those who oppose our action we must be ready with hammer of iron and rain of blood to make the obstinate and blind planters reflect, and to exterminate Somotaro Sheba, the traitor, editor of *Shimpo*, and his followers. We must prepare. If higher wages are not obtained, the sword may visit Sheba at any time, and he should provide for the livelihood of his family which will be left."

The strike is for an increase of about 40 per cent. in wages. The newspaper organ of the strikers denounces the indictments and attacks the local capitalists. In answer to questions about the

matter, Ambassador Takahira said, on the 12th, that he knew of no trouble in the islands except the dispute about wages. There was no Japanese political party there, he added, and there could be none, because the Japanese did not have the right to vote.

✽

Cuba and Porto Rico

In Havana the newspapers are discussing a report from Madrid that Spain will insist upon the assumption by Cuba of a part of the national debt incurred before the island gained its independence. President Gomez says he has received no notice of such a claim, and that Cuba is not indebted to Spain, except for cannon left in the forts. Governor Magoon consented that Cuba should pay \$300,000 for these.—President Gomez has commuted to imprisonment for twenty years the death sentences imposed by court martial in the cases of the two Corteses, father and son, sergeants in the Rural Guard, who were leaders in the little revolutionary uprising of March last.—The House, at Washington, last week, passed the bill providing that when the Porto Rican Assembly fails to make the annual appropriations those of the preceding year shall be duplicated. It also requires that hereafter all Porto Rican official reports shall be made directly to an Executive Department in Washington.—The revolutionists in Santo Domingo who were driven across the boundary into Hayti have been expelled from that country and are on the way to St. Thomas. Their leader was General Camacho, who had an army of 240 men.

✽

Venezuela Amicable relations between Venezuela and Colombia have been restored, and a Minister from Colombia has been received at Caracas with impressive ceremonies. A treaty has been signed providing for a settlement of all controversies between the two countries. Congress recently voted that Dr. Paul, special envoy to European countries, must be recalled because, when he was foreign Minister, in December last, he asked several foreign Powers to send warships to La Guayra

He has been recalled by President Gomez. In an explanatory statement he says he asked for the ships to prevent great disorder when the Gomez Government was established, and to convince the foreign Powers that the new Government intended to settle justly all the pending controversies.—Castro's brother, Celestino, recently expelled from Curacao, has been informed by President Gomez that he may return to Venezuela if he will give to the Government the 6,000 rifles which he has stored in Colombia.—It was asserted last week that 31,000 rifles had

EDWARD EVERETT HALL
New York, N. Y., and John H. Brown

been shipped from Belgium to New York, and thence to St. Louis, by Castro's agents, and that they were to be taken to Venezuela from New Orleans; also, that the small steamship "Nanticoke," recently undergoing repairs at an obscure port in North Carolina, had been sold to revolutionists in Castro's interest. On the 12th, the steamship was at Edenton, N. C., and her cargo appeared to consist of a large supply of coal. Dispatches from Caracas said that she had been bought by the Gomez Government

and was to be used as a transport; also, that friends of Gomez were to put her in service on Lake Maracaibo, in opposition to a navigation monopoly there controlled by Castro.

Shipwrecks The Cunarder "Slavonia" ran aground on a coral reef two miles southwest of Flores Island, Azores, on the night of June 9, while on the way from New York to Gibraltar. The wireless call for help, "C. Q. D.," was first caught by the North German Lloyd liner "Prinzess Irene," which was traveling in the same direction and about 180 miles to the south of the wrecked vessel. She at once came to the rescue, reaching Flores Island on the next evening, and the night was spent in transferring the cabin passengers to the "Irene." There was a heavy sea and the passage had to be made by the ships' boats, but the 110 men, women and children were safely transferred by Friday morning with no loss of life and few injuries. The "Irene" then continued her voyage to Gibraltar. The Hamburg-American liner "Batavia," also bound for the Mediterranean, was the next vessel to respond to the call and she received the 300 steerage passengers. The crew of the "Slavonia," numbering 150, then went ashore at Velas, on Flores Island, as their vessel was already filled with water.—During the manœuvres of the Russian fleet near Sebastopol the submarine torpedo boat "Kambala" was sunk by collision. The battleship squadron, in trying to steal into the harbor, was running without lights about midnight of June 11 when it was discovered by the "Kambala." The submarine ran half-submerged sufficiently close to the leading ship, the "Pamteleiman," to put it theoretically out of action with a torpedo, then turned thru the line of battleships and was rammed by the following vessel, the "Rostislav." The commander and three of the crew who were on deck swam off and were picked up, but the rest, three officers and seventeen men, went down with the vessel. Attempts were made to raise it quickly in the hope that it had not filled and the men might be saved, but as it lay at a depth of 28 fathoms this was impossible. The "Kam-

bala" or "Flounder," as it is in English, was a submarine of 180 tons constructed on the German type.

Earthquakes in Southern France On the night of June 11 the Riviera suffered several shocks, the most important occurring at fifteen and forty minutes after nine. The vibration was northeast and southwest. The greatest damage was done in the departments of Herault and Bouches-du-Rhone, but the shocks were felt all along the north shore of this part of the Mediterranean, at Nice, Cannes, Marseilles, Montpellier, Avignon, Nîmes and Perpignon. The disturbance extended to Spain and Portugal, and was sufficiently strong to cause alarm at Barcelona and also at Badalona, six miles northeast. At Aix-en-Provence the electric and gas lights were completely extinguished, and a vermicelli factory partially demolished. At Lambesc, a town of 2,500 inhabitants, twelve miles northwest of Aix, a large proportion of the buildings were destroyed, including a church of great historic interest. The neighboring villages of St. Cannat, Rogues, Venelles, Vernegues and several others were also badly damaged. The number of the dead is not yet known, as the ruins have not all been searched, but it is estimated at a hundred, and the wounded at three times that number. This region was the scene of a more severe earthquake on February 23, 1887, in which the loss of life was 650. The present earthquake may be the result of a further settling of the area disturbed in the recent Italian catastrophe, as shocks of unusual severity were felt at Messina and Reggio di Calabria a week before. A very serious earthquake occurred in Sumatra on the night of June 3, reported to have caused 230 deaths, but this is not supposed to be connected in any way with the Mediterranean disturbance.

Clerical Subscriptions in France The *Journal* is a clerical journal of France, devoted to Pius X and reactionism. It is shocked beyond language because some of the French clergy have subscribed to help in making *L'Éveil Démocratique* a daily in-

stead of a weekly. This newspaper is the organ of a band of youths, Catholic and Protestant, known as the *Sillon*, which has been condemned by many French bishops. Its object is to bring the young men of the land into harmony and good fellowship, so that the hateful terms, Papist and Huguenot, Gallican and Roman, will disappear. *Jaune* calls the "Sillon" laical and anti-clerical, and publishes the list of subscriptions on the part of priests, without, however, giving any names, who joined in toward making *L'Eveil Démocratique* a daily; 137 individual priests, plus 68 bands of priests or ecclesiastical professors, have given help thereto. Many subscribed 100 francs, some as much as 500 francs and even 1,000 francs. In sending his mite one wrote, "From a priest of Rennes in admiration of 'Marc's' answer to Cardinal Lucon." "Marc" refers to M. Marc Sanguier, the leading spirit of the "Sillon" and editor of its organ, while Cardinal Lucon is the priest's bishop. Another wrote: "A priest of Aisne; his savings of three years, 1,000 francs."

The Cretan Question

The near approach of the date set for the withdrawal from Crete of the European Powers which have a protectorate over that island has caused apprehension of serious trouble between Turkey and Greece. The war of 1897 resulted in a humiliating defeat of Greece, but one of the objects of the war was attained during the intervention of the Powers in practically freeing Crete from Turkish authority and appointing over it Prince George of Greece as High Commissioner. An autonomous government was established, and the Turkish troops withdrawn and replaced by an international garrison to maintain order while a native militia and gendarmerie were being developed. The Turkish flag is kept flying upon an uninhabited rock in Suda Bay, together with the flags of Great Britain, France, Russia and Italy. The four foreign Powers declared in July, 1906, that they would soon evacuate the island, and on July 27, 1908, the first detachment of foreign troops was withdrawn. According to the promises of the Powers, the evacuation must be complete at the end of a year from that date. The Turkish

Government, realizing that the withdrawal of the international troops would be equivalent to the annexation of the island by Greece, to which Turkey was not prepared to assent, has requested the Powers to reconsider their decision and keep their troops there. So far the Powers have not returned a formal answer to this request, but it is expected that they will accede to it for fear of trouble, which, however, will be difficult to avoid in any case, for, if the evacuation is postponed, the Cretans will declare themselves annexed to Greece, as they did last year, and there are certain parties in Greece which are talking war as loudly as they did ten years ago. On the other hand, the recently established Government of Turkey will suffer greatly in prestige if it loses its nominal sovereignty over Crete. The tame acquiescence of the Government in the loss of Bulgaria, Bosnia and Herzegovina, in consideration of a monetary indemnity, has given grounds for the charge of the reactionaries that constitutional government means the dismemberment of the Ottoman Empire, consequently the Government may be forced to make war upon Greece, and a successful campaign would unite the people of the new régime. Enver Bey, who started the revolution resulting in the overthrow of absolutism, and who is now attaché of the Turkish Embassy at Berlin, is reported to have said that "The breaking loose of Crete will mean war. Athens could be reached as rapidly and with the troops in as good order as was Constantinople recently."

—An attempt is said to have been made at Salonika to rescue the deposed Sultan from the villa where he is confined. The attempt was frustrated, but several officers were killed in the struggle. —The rebellious Albanian tribes are said to have been defeated at Djakovitch in a fierce engagement with twelve battalions of Turkish troops.

The British Navy

Every effort has been made to convince the British Press Conference meeting in London this week of the importance of a larger navy. The keynote was struck by Lord Rosebery at the opening banquet, given by a thousand British newspaper men to their fifty-seven guests from the colonies. He asked them to carry the

message to their homes that the situation is ominous, and to tell of the efforts that are being made in England to keep up with other nations in arms. There was an absence of questions which ordinarily might be expected to lead to war, he said, but yet the threatening and overpowering preparations for war in Europe were unprecedented in history. Foreign Secretary Sir Edward Grey, speaking later, stated he would endorse every word of Lord Rosebery. The political weather, the Foreign Secretary said, was "sultry":

"If the navy fails it will be useless to discuss any other subject. To keep what we have got, to consolidate and develop, to quarrel as little as possible with other peoples, and to uphold in the councils of the world the ideals of Great Britain. With so much at stake the maintenance of the navy must be the first considerations, not only for the home Government, but for all the self-governing dominions of the empire."

Later in the session Secretary of War Haldane, Field-Marshal Earl Roberts, and Arthur Balfour, leader of the Opposition in the House of Commons, spoke to the same effect. Mr. Balfour said that the fate of Australia, New Zealand, Canada, South Africa or India was not going to be decided in the Pacific Ocean or the Indian Ocean. The individual constituents of the empire could never be safe and could never be powerful and strong if their defense were only local. The German Ocean, the English Channel and the neighborhood of the British Islands, he said, were to be the theaters in which an Armageddon, should there be one, would take place. The only break in this series of warlike speeches was the address of Lord Morley, in which he denounced the "rebarbarism of Europe" in the reversion to arms, and called upon newspaper men thruout the world to work together for peace among the nations, because he believed the press more responsible for the war fever than all the officials and diplomatists put together. The English tongue, he said, was a stronger and more enduring bond of imperial union than anything else, a thousand times stronger than all the achievements of soldiers and sailors, and the statesmen who had directed them.

"I know of no more stupendous and overwhelming fact than the supreme dominance of

the English tongue over the military in the new world in the West and the ancient world in the East.

The delegates attending the conference were taken by the Admiralty on an excursion to Portsmouth to inspect the fleet, the most powerful naval force ever brought together in the history of the world. The ships of the Home Squadron numbered 144, the total cost of which was nearly \$400,000,000. Most prominent were the seven new battle-ships of the Dreadnought type; besides which there were seventeen other battle-ships, twenty-four cruisers, thirteen scouts, forty-eight torpedo-boat destroyers and thirty-five submarines. If placed end to end the vessels would have formed a double line eighteen miles long. The submarines, as they came by the press boat, gave an exhibition of diving, and the destroyers discharged torpedoes at the Dreadnought in the way of a salute, the torpedoes being caught by the nets surrounding the battleship. A sham battle of a very realistic character was fought at Whale Island, the gunboats attacking a force of bluejackets entrenched on the shore. They effected a landing with large guns, only to be driven back into the sea by the arrival of an armed train, when, at the sound of the band playing "God Save the King," all the combatants, living and dead, rose to their feet and saluted.—The British Finance bill, of which we gave an abstract in a recent issue, was passed on its second reading by a vote of 366 to 209. The reduction in the Government majority was due to the opposition of the Nationalists, who believed that an active union was violated by some of the provisions of the bill.—South African union is an accomplished fact. The legislatures of the Transvaal, Cape Colony and Orange River Colony promptly confirmed the constitution in its amended form as adopted at the Bloemfontein convention, and in Natal, where the greatest opposition was manifested and the question had to be referred to a referendum, the constitution has been adopted by popular vote of 11,121 to 3,701. The four colonies will therefore form a single nation with a strongly centralized government. The constitution will now be brought before Parliament for ratification.

Science and Human Brotherhood

BY WILLIAM ENGLISH WALLING

[Our readers are familiar with Mr. Walling's contributions to *The Forerunner* on labor and social topics and especially his articles on the Russian revolution. Since his return from Russia, a year ago, he has been giving much attention to the negro problem, and it was he who was the prime organizer of the successful negro conference held in this city, May 31. We commend the following highly significant article to the attention of all thoughtful people.—EDITOR.]

ARE we about to abandon the idea of brotherhood of man? Does modern science divide humanity permanently into inferior and superior races? Does it justify in any way those who contend for the dominant importance of blood and heredity in human affairs? Does it give a basis for an up-to-date adaptation of the age-old belief in aristocracy and caste?

We can no longer dismiss this question as tho it had been solved by the American and French revolutions, or at the latest at the time of the abolition of slavery among the white races half a century ago. The real or pretended belief that underlies all slavery, that the children of certain perfectly healthy human beings are bound to grow up inferior to the children of other human beings, has more followers in the civilized world today than it has had for a hundred years.

In the United States and Europe the belief in the existence of a "natural" hereditary aristocracy has gained the upper hand among conservatives and among progressives alike, and is now winning a foothold where it never had one before—that is, among political radicals and leaders of scientific and philosophical thought.

I was sitting at the table not so long ago with a number of Northern radicals, including some who called themselves socialists. The race question came up. A professor of political science at a leading university said: "If my daughter fell in love with a negro, I'd kill her rather than see her married to him." When I suggested that he could scarcely be a socialist, he answered: "Socialism has nothing to do with the brotherhood of man."

A few days later I sat down with a writer as radical and well known as any in the country. This gentleman claimed

that Haeckel, or some other scientist of note, had said that the negroes had probably evolved from another race of monkeys than the whites, and he supposed it would take fifty million years of racial evolution "to raise their brows one inch" until they equaled our own!

I appeal to any one who has discussed this question or late among radicals of the North or among Englishmen or Germans, to say whether he has not had many similar experiences. For my part I have more often heard the prejudices supported than attacked. For instance, a leader of the Socialist party, the organization to which the "class struggle" between capitalists and workers is everything, has announced in public, apropos of the Japanese immigration question, the Socialist heresy that the race struggle is an even more important "economic law" than the Marxian formula of class conflict.

The reader will readily recall the more and more cautious attitude assumed in public by the friends of the negro in the North. The exclusive endorsement of Booker T. Washington's negro policies, now nearly universal in the North, is tantamount to a postponement of the demand for immediate political and social equality of the races. Washington does not want the negro to make a special effort now either to obtain the ballot, to extend his higher education or to demand equal civil rights. As these are the only rights universally denied by the Southern whites, this is equal to a general postponement of the negroes' claim for political and social equality.

Even men like Roosevelt, who as whites can easily afford to assume a more courageous tone than Washington, are restrained by prejudice or fear from the simple justice of insisting that the color of a man's skin be ignored by our laws. In his recent speech to the Y. M.

C. A. at Washington, while this demand in the abstract was indeed on the President's lips, he spoke not a word for the enforcement of the Fourteenth Amendment or for the abolition of the shameful civil and educational disqualifications forced on the negroes by the reign of terror in the South, but confined himself to the economic question.

The portentous interest of this growing prejudice in the North is not so much that it concerns the fate of eleven millions of our colored fellow countrymen and of the fifteen million Southern whites who are degrading themselves by their persecution as that it indicates a shifting in the whole basis of our political and social thought. For the fundamental and permanent inferiority of the negro to the white cannot be posited without conceding similar differences between other races and giving inevitable if indirect support to the whole theory of blood aristocracy and caste. This means nothing less than a revolutionary change in the most fundamental life principle on which our nation has been evolved. This is not a contest between radicalism against conservatism, but of progress against the sinister *reaction* of Eastern Europe.

Obviously this new theory of the dominance of the "fittest" races is a backward step from the ideas that prevailed among the intellectual élite of the North at the time of the emancipation—a renunciation of the most cherished and fundamental beliefs of Lowell, Phillips and Emerson. It is worse than that. Before the war the opinion against slavery was aggressive and alert; now when the Southern negroes are robbed of the only protection they have against governmental servitude, their right to vote, the North is lenient or tolerant; the nation, far from being ready to go to war for the principles of human freedom, has been unwilling to raise its hand to save the Fourteenth or Fifteenth Amendments—perhaps the most important results of our terrible fratricidal conflict.

The reaction is a return not only to the period before 1860, but to the European absolutism of the early eighteenth century. It is to forget all the lessons

taught Europe by Rousseau and Danton and America by Franklin, Jefferson and Paine. At this early period, if the masses even of educated mankind were still unenlightened as to the wrong of human slavery, at least the philosophers were wholly against it. Now it seems, philosophy, such as it remains to us today, and its great successor, science, are both quoted against the rights of man, while many of their leaders are actively taking part in the campaign against human freedom.

The reaction is not a denial merely of the democracy and equality of Jefferson or Franklin, but also of the *universally* accepted ideas of our revolution as embodied in the Constitution, including the relatively conservative position of Hamilton and Madison. For, tho it may be contended that this instrument retains some elements of monarchism, and its failure to indorse universal suffrage undoubtedly impugns its democracy, at least it abolished hereditary rule and hereditary privileges, the principal points of attack, indeed, of the Revolution. Aristocracy was destroyed except in the South, and the institution on which that oligarchy was based was strictly limited by the Northwestern ordinance passed as early as 1787.

Aristocracies have always compared themselves to superior and well-bred animals, and the Southern aristocracy applied stock-breeding principles to the negroes. Thanks to the new doctrines of the survival of the fittest, these principles, anathematized by our Revolutionary forefathers almost to the last man, are to be applied to the whole human race. Is it not significant of the new reactionary spirit of our time that the able and very often humane and advanced Socialist, Bernard Shaw, should be a leading expositor of "Eugenics," Galton's proposed science of human breeding? Shaw suggests only half humorously that the future will see a lethal chamber for those who ought not to be allowed to breed. The subject has become a leading one in the British magazines, and, as might have been expected in this aristocracy-laden atmosphere, has received support from all directions—even from scientists like Prof. William

Ridgeway, president of the Anthropological Section of the British Association.

Reforms, Professor Ridgeway claimed before the last meeting of the Association, were still based on the fundamental fallacy that there is no difference between the average child of the laborer and the average descendant of the middle classes. It was still thought that the only thing necessary to make the children of the working classes equal, if not superior, to those of the bourgeoisie, were the same food, the same clothing and the same educational advantages. Professor Ridgeway concluded, it will be remembered:

"If the present policy of legislators is adhered to, the moral and physical standard of the British citizen will steadily deteriorate, for the population will gradually come to consist of those who themselves have sprung from many generations of the most unfit. Should this unfortunately come to pass, it will be the result of human pride refusing to apply to the human race the laws which inexorably regulate all nature."

We are not answering Professor Ridgeway's assertion by a counter argument. We shall not stop to show that the middle classes of the present generation are better developed because more advantageously placed both in home and school, especially in Great Britain; that the degeneration of the British workingman is due not to the fact of his parentage—he is often of healthy country stock—but to the fact that British society has starved him from the cradle to favor the middle and aristocratic class. No, we are quoting the professor to show that caste prejudice is the larger term, of which race prejudice is only a part; that the whole basis on which our modern semi-democratic societies rest would be undermined by his teaching; that it spells "reaction" in its most terrible form.

The "scientific" doctrine of human inequality was not born yesterday. It had its earliest origin in the middle of the century, after the abolition of slavery in Russia and the United States, when reactionaries needed some new basis for human servitude. The theory reaches its worst form perhaps among English-speaking writers. Haycraft, in "Darwinism and Race Progress," rejoices in the prevalence of alcoholism and contagious

diseases among what he calls the "inferior races," while Nott and Gliddon, in their belief in the inferiority, not of the negroes alone, but of all dark complexioned and round-headed races, regret that Napoleon I did not cut off the heads of all the demagogues who were not blonds. As usual, the Continentals are less hypocritical and more brutally frank in the language they employ. The German, Ammon, *recommends* that the same means be used with the "degraded" races as are used by the European toward negroes and savage people: namely, drowning them in alcohol and attracting them to places where debauchery reigns supreme. The Frenchman, Lapouge, is still bolder. In an article in the *Revue d'Anthropologie*, he says, in his advocacy of "Eugenics," that the fathers of the future race should be limited to some two hundred thousand chosen individuals the world over, and that then an artificial fertilization of females should be instituted in order that a sufficiently numerous generation should result.

If it were not for this general scientific atmosphere, it might seem a mere eccentricity of genius that Rudyard Kipling, by far the most popular, if not the most able, writer in English today, should have adopted the creed of racial superiority in its most virulent and aggressive form. But the service which the inventor of the phrase "the white man's burden" has been able to render to the oppressors of the so-called "lower" races the world over is due to forces entirely outside the writer's individual genius. The way was prepared for him by such scientists as we have mentioned, and from his young manhood he has had no difficulty in finding authorities for those beliefs of his which sum up excellently the anti-social philosophy of our time.

Kipling has now concentrated his ideas on human evolution into a single *attack*—for he who strikes at the unity of humanity strikes at the race itself. Into his latest story, "The Adventures of Melissa," recently published in *Collier's Weekly*, he has poured all his bitterness and hatred against what has hitherto been our social faith. The story of the bees has been utilized by Maeterlinck in a study as scientific as it is poetical, to

give to humanity a profound and inspiring insight into the social nature of evolution. To Kipling it teaches only that the race evolves by degeneration and death. Like his elder brother, Nietzsche, Kipling takes as his point of departure the fact that a hive of bees (read "A Human Society") is likely to degenerate. The degeneration itself is the original mystery, and all the ill ordering of the hive is not the cause of the degeneracy, but its effect. Because of this *innate* degeneracy or *original sin* of the hive, it is afflicted with parasites and all the other ills of human societies. To the unfortunate and degenerate, thus mysteriously and spontaneously created, Kipling applies every possible term of contempt. They are: "Oddities, albinos, mixed-leggers, single-eyed composites, faceless drones, half queens and laying sisters." Nor does the author scruple to identify these oddities with the great mass of British working people.

We shall not stop to show that, from the standpoint of the much more thorough knowledge of the bee displayed in the special studies of Maeterlinck, Kipling's science is fundamentally false. We only mean to point out again the misanthropy and the far worse than Machiavellian politics that it teaches. For the fate of a degenerating hive is, according to Kipling, destruction, certain and complete.

The whole standpoint is, as he definitely avows, in no sense new, but simply a statement in modern scientific slang of the world-old principle of "tradition" against progress. It is thus Kipling himself who stands for the only really degenerating elements of modern civilization, namely, the hoary old traditions that humanity has long ago been trying to slough off. For if we are not subordinating precisely that element in humanity which he wishes to emphasize, i. e., the merely animal, then indeed we must have been degenerating, not only in the present generation, Kipling's special point of attack, but ever since we have passed from the savage into the civilized state. Kipling says what we need is "the old legends" and not "new principles." This is the very language used by the romantic reactionaries in Germany at the time of the Holy Alliance

against the French Revolution, the language that was later used all over Europe in the reaction of 1849, and the very words that, in the mouth of Nietzsche, who owes a part of his influence to the military prestige of Prussia since 1870, now almost dominate literary Europe. Before the French Revolution traditions were everywhere called "the good old times." In the later reactions they were called "historical points of view," and since the victory of Prussia they have been popularly known as the standpoint of "Evolutionary Science." Kipling recognizes that these are so many terms for a single thought.

Now let us glance at Kipling's remedies for a typical "degenerating" society of bees or men as brazenly proposed in his "Melissa." The very beginning of the story rests on the outworn Malthusian doctrine. "If," he says, "the stock had not been old and overcrowded the wax moth would never have entered; but where bees are too thick on the comb there must be sickness and parasites." His remedy is "a new swarm" or a migration to the colonies. These "new swarms" are dependent, however, for their very formation on the rediscovery of the "almost lost art of making royal jelly." Here, as elsewhere, Kipling stands clearly and positively not only for the caste, but for the restoration of monarchy.

Giving still freer rein to his reactionary passion, in the paragraph in which he advocates the protection of the hive (England, of course, for what other hive exists for Kipling?) from foreign invaders (read the Germans), the latter are denominated as "Death-Headers." Whatever may be the reality of the role played by the "Death-Head" moth among the bees, we do not recall a more frightful allusion in modern literature.

We shall scarcely stop to defend what is perhaps the greatest of civilized peoples. Germany, indeed, has hitherto led us not only in our socialism but in reactionism also. The master genius of reaction is Friedrich Nietzsche, whose most violent misanthropies, not yet equaled, were attained a full decade in advance of Kipling's. For Nietzsche has been the most influential writer in the classical country of science for men-

ly two decades. And now that his influence has passed its climax in Germany, it is just reaching its full height in other countries of the Continent. Nietzsche believes, as is known, that the whole human race, not merely the race of his enemies, is degenerating, and the only hope lies in breeding a new and distinct species. The East Indian "Law of Manu," which maintains the notorious castes of that country, is to him the "grandest" example of how his ideas can be put into execution. To show that he knows what this implies, let us quote:

"How paltry is the New Testament in comparison with Manu, what a bad odor it has!—not, this time, in combat with the beast, but with *its* own antithesis, the non-caste man, the mishmash man, the Chandala. And again it had no other expedient for making him harmless, for making him weak, except making him *sick*—it was the struggle with the greater number.

"Perhaps there is nothing more repugnant to our feelings than *those* precautionary measures of Indian morality. The third edict, for example (Avadana-Sastra I), 'concerning unclean pot-herbs,' ordains that the sole food allowed to the Chandalas shall be garlic and onions, considering that the holy writings forbid giving them grain, grain-bearing fruits, *water* and fire. The same edict ordains that the water they require must neither be taken out of rivers, springs or ponds, but only out of the entrance to swamps, and out of holes made by the footsteps of animals. In the same manner they are forbidden to wash their clothes and *to wash themselves*, since the water which is conceded to them as a favor must only be used to quench their thirst. Finally, there is a prohibition forbidding the Sudra women to assist the Chandala women at childbirth, in like manner also a prohibition forbidding the latter *to assist one another on such occasions*. . . . The result of such sanitary regulations did not fail to appear: deadly epidemics, frightful sexual diseases."

"Here at once," continues Nietzsche a little farther on in his "Twilight of the Idols," "we have *Aryan* humanity, perfectly pure, perfectly original, and we learn that the idea of 'pure blood' is the contrary of a harmless idea."

It is its very harmfulness to the Chandala or lower caste, in other words, that leads Nietzsche to give his enthusiastic homage to the Law of Manu.

In the same work he applies the law of animal life, the survival of the fittest, to human marriage, which *cannot* be founded on "love" (the italics and quotation marks are Nietzsche's), because "it is founded on sexual impulse, on the im-

pulse to possess property (woman and child as property), on the *impulse to rule*, which constantly organizes for itself the smallest type of sovereignty (family), which *needs* children and heirs to maintain physiologically an acquired measure of power, influence and riches, to prepare for long tasks and for instinct-solidarity *from one century to another*" (the last italics are ours).

This is the aristocratic idea of family founding with a vengeance! It reminds us of Burke's assertions over a century ago that England will *ever* preserve an Established Church, an established monarchy, an established aristocracy and an established democracy, *each in the degree in which it exists and no greater.*" The new defender of aristocracy and caste merely clothes his principles in up-to-date "scientific" form.

Nietzsche's politics are in everything remarkably similar to the politics of other critics of the great revolution, from Burke's time to ours. One of the later of these, Taine, greatly admired of Nietzsche, fears the declaration of the Rights of Man on precisely the same grounds on which Nietzsche attacks democracy in the work already quoted:

"The workingman has been made capable of military service, he has been given the right of combination and the right of the franchise: no wonder he already feels his existence as a state of exigency (morally expressed, as *injustice*). But what do people want? let it be asked once more. If they want to realize an end, they must also be willing to use the means; if they want to have slaves, it is foolish to *educate* them to be masters."

Nietzsche, we see, is no coward; he dares to confess repeatedly that his school wants nothing less than world-wide slavery for the working class. And as there must be slaves, there must be masters. Humanity has not yet developed its super-man, but Napoleon and Cæsar Borgia were offered to fill the gap!

All is based on "Science." In the same work in which the world was introduced for the first time to "the splendid blond beast, lustfully roving in search of spoils and victory," we are told definitely that this animal, however Roman, "Aryan" or primitive German, is definitely the "Darwinian beast." The cruel Japanese nobility, Homeric heroes, and Scandinavian Vikings are specifically

mentioned, but they are all of the "Darwinian" stock.

In "The Twilight of the Idols" Nietzsche even develops a critique of Darwin, in some points masterly, as is true of nearly everything from the pen of this Machiavellian genius. It contains a confession that it is precisely the animal and unintellectual virtues of the "blond beast" that he worships, but a confession also that, after all, he is no follower of Darwin.

Says Nietzsche:

"Darwin forgot the intellect; *the weak have more intellect* (!). One must need intellect in order to acquire it; one loses it when it is no longer necessary. He who has strength rids himself of intellect. It is obvious under intellect I comprehend foresight, craft, patience, dissimulation, grand self control, and all modifications of mimicry."

We also may cast out craft, dissimulation and mimicry, but we cannot, like Nietzsche, regret the dominance, thru superior intellect and numbers, of those who possess greater patience, foresight and self-control.

In a word, the great German prophet of a degenerating humanity finds "the symptoms of declining life," to quote another passage from his "Genealogy of Morals," "in the rising of democracy, of peace arbitraments in place of war, of the equality of woman with man, of the religion of sympathy (Christianity)." Have we not every reason for supposing Kipling to share these views, at least in large part, even if he expresses them sometimes in parables and allusions? Are they not secretly or openly avowed by a large and growing part of our intellectual *élite*?

But let us now examine a little more closely that "science" on which all this literary and philosophical structure is founded.

In England and America, in France and Germany, and in the other civilized countries, it is the "anthropologists" who have lent the most constant and active support to the false doctrines of caste and race; but they are at last thoroly discredited. Among others the French writer Finot, in his book, "Race Prejudice," now translated into German and English and in the third French edition, has shown the utterly untenable position of this pseudo-anthropology, even tho it has filled thousands of volumes of

more or less "scientific research." The book has already had a remarkable reception and must exert a great influence for the truth. It has received the warm approval of Nordau and Brandes, of the French and German sociologists, and of Lombroso, who says that the book has demolished the "inanity of the theory of race prejudice." President Roosevelt has given his approval, and H. G. Wells has said that its destruction of anthropological stupidities is nothing less than invaluable. This work of Finot's has the triple value of summing up the theories of race prejudice, of showing their essential futility and of proving the fundamental unity of the human race.

Not every advocate of fundamental race differentiation is so extreme as those I have mentioned in these pages. Finot handles all alike, with politeness and patience, quoting as authorities against them hundreds of the world's leading anthropologists. He points out first of all that the most recent biological researches have shown that the evolution of plants and animals is probably for the most part by another principle than that of the celebrated "survival of the fittest," which has so long held the field. The prevailing view today is that a more important rôle is played by the "accidental" birth of exceptional individuals, called scientifically sports or freaks. If these new individuals happen to be adapted to the environment, they may then perpetuate themselves and become a new type—on the added condition that the new variation is so great that its intermixture with and therefore ultimate obliteration in the old race is not physically possible. Only if these "freaks" breed with themselves and not with the older race may a new species be created. There is only one race of human beings, then, as there is no question that all varieties of mankind can still intermingle as they have done all thruout history from ancient Egypt to the United States. There are no human "races" in the biological sense of the term.

As to human varieties, it was attempted at the time of the slavery controversy to classify them by the color of their skins, as white, yellow, black, red and brown. Any educated person today is able to prove the scientific inadequacy of any

such classification even for the purpose of differentiating humanity into varieties, to say nothing of races. We all know how the color of so-called races has changed historically among the various nations. Anthropology now proves that there is not only a variety of men properly denominated as white which has, nevertheless, an ebony black skin (the Moors of Senegal), but also that there are white or yellow skinned varieties which by their other features may be better classified as blacks (like the Bushmen).

We need not stop with these or any of the other long-abandoned criteria of race, since they have all been replaced by the new and so-called "scientific" theory of the measurement of skulls, craniometry. After having produced its thousands of volumes this science also, however useful for some purposes, has now proved to be utterly useless for ethnology or the scientific classification of the race. It has been almost universally contended by those supporting the doctrines of inferiority that the long-headed or dolichocephalic races were the "higher" ones, while the brachycephalic were "lower." It is now discovered that among those races that are confessedly most backward and are therefore usually classed as most inferior, are the very ones with the longest skulls. Among these, with a cephalic index under 76, are the Hottentots, the negroes of the Kongo, the Ashanti, the Panches of New Guinea and many Australian tribes, along with the Corsicans and Portuguese, who have not usually been reckoned as the highest of European types. On the other hand, among the brachycephalic races, with an index between 82 and 84.8, are some so-called "superior" races—the larger part of the French, the Russians, the Hungarians, the Russian Jews and many others acknowledged as highly developed.

The result of these disclosures has been that the advocates of the doctrine of racial inferiority are abandoning skull measurements also as a crucial test, and are now totally at sea for any physiological data on which to rest. This leaves them only psychological analyses, which I must reduce to a cruel absurdity by mere quotations of endless contradictions

from the various "authorities" on the subject. Critics, especially historians, have acknowledged that he and others have demolished the superficial theories of so-called Aryan, Germanic and other "superior" races, by showing that these are neither distinct races nor superior according to any given test.

There is no denying that there are more or less vaguely marked varieties of humanity, but they are so mixed and change so readily under various environments that it is impossible to make any satisfactory classification. Not only have most of the races been mixing since the dawn of history, but the anthropologists have found signs that this mixing took place also in prehistoric times. Skulls suggesting the negro type have been found so often in the European caves that at least two scientific observers, Sergi and Brinton, contend that the white races of Europe are largely of negroid descent.

The "demonstration" of inferiority by skull measurements has no sooner collapsed than it is sought to put new life into the effort at racial differentiation by the contention that these very race mixtures lead back to an older and inferior type of man, our common primeval ancestor. At a time when the most marked racial degeneration is taking place among the British, who, of a very mixed blood, like all the rest of us, are yet the purest bred of the great peoples, and when few peoples, as a whole, are showing a greater physiological advance than those of the United States, the most mixed of all, the age-old argument for "pure blood" is actually finding scientific support among us!

Prof. William Z. Ripley, of Harvard, who has just presented this view to the general public in a new and moderated form, does not contend that all race mixtures are nefarious. But he does contend that extreme race mixtures lead to "a reversion to the common ancestral type." We must recognize the full significance of the term "reversion." It means that we would lose all the physiological progress which anthropologists agree the race has been making in thousands and tens of thousands of years. In trying to penetrate into Professor Ripley's reasoning, we notice that he speaks of the ex-

extreme race mixtures which he fears as "abnormal" and due to a "forcible dislocation." But he is certainly aware that the intermixture of races, tho greater now than during those centuries when higher civilization gave for the first time to a majority of races a certain geographical fixedness, is perhaps even less than at that still earlier period when the majority of races were nomadic. For in all the most ancient civilizations, serious admixtures arose every few generations with the greatest regularity—apparently almost according to a law by which the nomads invaded the semi-civilized countries the moment they had recuperated new strength after their exhaustion from former inroads.

We get a closer insight into the nature of Professor Ripley's fears when we note his peculiar concern for the racial future of the so-called "Anglo-Saxon America." It would seem indeed from these expressions that Professor Ripley's fears are based not alone on a scientific hypothesis, but also on a feeling that there is some physiological superiority in an "undefiled" Anglo-Saxon race—to borrow one of his adjectives.

In opposition to this unfounded fear stand many of the highest authorities of America and Europe. The great father of anthropology, as he may well be called, one of the proudest productions of our civilization, Professor Tylor, found the most beautiful type of human being among an admixture more extreme than that of Ripley's "Hun" and the Anglo-Saxon; namely, among a race of mulattoes bred from negroes and European whites, a people he found on the island of Tristan da Cunha. So, too, some of the races whose physiological conformation and psychical qualities have been most praised by the anthropologists have been found in mixtures of the Dutch and Hottentots, of the Indians and Spanish, and other races separated by the widest possible divergencies. Some of these human varieties, in opposition to what Professor Ripley says, have been found not only the longest lived, but the most fruitful of all humanity.

We do not need to recall the remarkable number of geniuses who have been of mixed blood. Some, like Ibsen, were

only of two branches of the Teutonic race, but others, like Dumas, were descended in part from negroes. Some of the greatest Englishmen, like Rossetti and Disraeli, have been in part of an utterly alien blood, and the same thing has been true of some of the greatest writers of Russia and the United States. Indeed, the very fact that the human race has advanced in the last few thousand years, as all anthropologists are agreed, strongly reinforces the belief that the most general race mixture is beneficial to humanity and leads not to a reversion to an ancestral type, but to the maximum of progress; for intermixture has been almost universal. The Moors and Abyssinians, both types of mankind whose development is comparable with any of the European races, are composed of a mixture of Arab and negro stock, while similar mixtures have produced in other parts of Africa several so-called negro races which anthropologists agree in giving a very high place. The intermixture of Europeans and Asiatics has been more intimate. The Hungarians and Finns are largely of Mongol blood, and neither race is considered to be inferior to any in the world. Leroy Beaulieu has shown that the race known as Russian, tho perhaps the larger part of its blood may be Slavic, is composed also in very large part of an admixture of Finnish types. Indeed, the Slavophiles among the Poles and other somewhat purer Slavic races are disposed on this account to give the Russians an inferior position racially to themselves—a position by no means accepted by that great people. In the Volga region the Tartars have for many generations maintained just as high a civilization as the Russians and admixture is very common. In Siberia, where admixture with the Tartar and Turanian stock is common and almost general, there are also very successful mixtures with other Mongolians even nearer to the Chinese than are the Finns.

Now we are having the good fortune to secure in large numbers these Mongol-Finns and Mongol-Hungarians, as well as Semitic races, in America, none of them certainly of the so-called Aryan or Caucasian stock. And having advanced from intolerance of any but the

Anglo-Saxon race to tolerance of the German and Irish fifty years ago, and later to tolerance of the Italian and Slav, we have no question that our people will soon hold an equally open-minded view of these newer races. In the backward section of the South, indeed, where the negro question has maintained senseless race prejudice in all its virulence, not even the Italian and Slav are yet altogether welcomed; but our growing national unity will some day settle this problem along with that of the negroes and every other question of race.

The advance of humanity, then, has been to a large degree due precisely to this race mixture, especially thru the mixture of those races most widely differentiated, and the biological reasons for this are clear. Expressing the biological case positively, we may say that the intermixture of widely varying races moderates or equalizes those exaggerated, tho perhaps normal, developments caused by the one-sided environment in which certain races have dwelt too long. Expressing the same law in its negative form, we may say that such admixtures prevent the intensification of physiological and psychical abnormalities thru the intermarriage of persons from the same stock or environment, who are therefore likely to be afflicted with the same weaknesses or tendencies of disease. For instance, even the most sober and healthy of those European nobilities or upper middle classes that insist on intermarriage within their group show increasing eccentricities and diseases, due unquestionably to this cause. In opposition to such false marriage traditions we have the instinctive exogamy of healthy primitive peoples. As is well known, the custom of intermarriage outside of the clan or tribe is prevalent among nearly all tribal organizations.

Science not only denies the existence of any *rational* basis for a fundamental differentiation of human varieties, but refuses to admit that there exists in normal human beings any *irrational* feeling or instinct of racial antipathy against members of an alien race to which they are accustomed.

Where considerably different and clearly marked varieties of mankind are

living side by side, the temptation for the more developed to keep the more backward in permanent subjection seems, indeed, to be almost irresistible. But this tendency, which prevails in our own South, is not due to instinctive race hatred. It has been shown by the able anthropologist and sociologist, Prof. W. I. Thomas, among others, to be due not to racial antipathy, but to caste. In the face of the wholesale illicit love of white men for colored women, of the affections of white women and children for colored nurses, and a dozen other instances of the friendly feelings and love of the whites for the blacks given by Professor Thomas, himself a Southerner, it is ridiculous to assert that the white race instinctively hates the blacks. The whole of the truth is that the whites as a rule hate to have the lower caste of the South, who happen to be blacks, on a level with themselves. *As at least two reputable and conservative Southern Governors have clearly stated, what the respectable and aristocratic whites of the South want is to keep the negro in a position of inferiority.

At the American Bankers' Association, in the fall of 1907, Governor Swanson, of Virginia, said:

"At last the offices, the business houses and the financial institutions are all in the hands of intelligent Anglo-Saxons, and with God's help and our own good right hand we will hold him (the negro) where he is."

Hoke Smith, Governor of Georgia, expressed a similar idea in these words:

"Those negroes who are contented to occupy the natural status of their race, the position of inferiority, will be treated with greater kindness."

Aristocracies have usually claimed friendly feelings for slaves, whether of their own or another race—as long as they accept their servitude.

The North, too, is being tainted with the same inhuman caste spirit. What is the meaning of the strikes of white students and the exclusion of negroes from school after school in such States as Iowa and Michigan? Have the school authorities supported any of the charges against the negroes? No. These strikes, for which no parallel may be found in Russia, simply show that the innumer-

*"The white race," says Hoke Smith, "is the only race that has the right to rule." — *Baker*.

able attacks on human brotherhood made recently in the name of history and science, being so weakly opposed, are at last taking root among our youth. If at the time of the recent and wholesale disfranchisement, the North in righteous indignation had cut down the Congressional representation of the South by one-third, as the Constitution demands, would the Springfield and other Northern anti-negro riots have taken place?

While the negro's enemies are aggressive his friends are benumbed by the new and undemocratic "culture" our universities and publicists have been importing from monarchical and aristocratic Europe. That same Europe which was almost at the feet of Washington and Lincoln is now become our political preceptor and given free rein to corrupt our literature and our youth. At least we might continue our own democratic tradition in politics, remember what our forefathers died for, and see to it that millions of American citizens should never be reduced to political servitude. Then the sinister designs and reactionary reasons of this new "Science of human inequality" would become the main issue before the American people. We would discover whether we did indeed have a message for the world in 1776 and 1861; or whether, by the light of this new German and English culture, our whole political evolution has been a mistake; whether we must adopt the monarchy and caste rule of Germany, England's shameless exploitation of India, and the brutal aristocracy and militarism of Nietzsche and Kipling, or, despising any

suggestion of hereditary inequality of race or class, continue that democratic development which is the one thing that has given character and the first world-import to the history of the United States.

Here are two powerful world movements, equally aggressive and vigorous: The movement toward democracy, hitherto led by the United States and now newly shared by the people of Russia, Japan, Turkey, Persia and by a growing minority in Egypt, China and India; the movement for less democracy and more empire, supported by a bare majority of the English and Germans at the terrible expense of the lower classes of both countries and the ruin of the subjected peoples. Are we about to see the anti-democratic principle redouble its strength in England and Germany and obtain the upper hand in the stronghold of democracy? Or will the defenders of individual freedom, social justice and human brotherhood awake in time to the danger of the most monstrous reversion in history since the foundation of the religions of human brotherhood and love two thousand, yes, three thousand years before the period when the world was made physically one by steam and electricity, and half the population of the earth became sufficiently enlightened to claim a share in the world's progress?

Has not the time arrived when something should be done, when the propaganda of hatred should be checked, when democrats and lovers of humanity must once more subordinate every cause to the great and underlying cause, and center all their efforts, as of old, around the struggle for human brotherhood?

NEW YORK CITY.

The Rationale of the Anglo-German Hubbub

BY W. T. STEAD

EDITOR OF "THE REVIEW OF REVIEWS"

"THE American public," the editor of THE INDEPENDENT tells me, "does not clearly understand the situation between Germany and England, and we are at a loss to appreciate what all the hubbub is about."

Fortunate Americans! May you ever enjoy such a vantage ground of security as to be unable to realize the alarms which from time to time disturb the tranquillity of other nations.

I should despair of making Americans understand the rationality of the apparently irrational uneasiness that prevails in Germany and Britain were it not that a very simple illustration lies ready to hand, which, if it be properly considered, will give the key to the enigma.

Have you never reflected upon the different ethics which prevail among men who are struggling for life in deep water and the same men who are on *terra firma*? A man swimming for his life, keeping with the greatest difficulty his head above the waves, is held to be justified in choking his own brother if that near relative, clutching hold of the swimmer, is dragging him down to death. In other words, the ethics of homicide varies according to circumstances. What would send a man to the gallows if done under normal conditions on dry land becomes justifiable and even commendable homicide when it is done in deep water. Now, the whole difficulty which Americans experience in endeavoring to comprehend the Anglo-German hubbub lies in the fact that they naturally apply the ethics of men who are safe and sound on solid ground to the actions of men struggling for life out of their depth in a lumpy sea. Americans are free from all danger of a sudden attack which, if fortune favored, might destroy the independence and the integrity, possibly even the existence, of their state. Hence they

find it impossible to conceive the motives or to understand the fears of their less fortunately situated neighbors. But if they will keep in mind the difference between the ethics of men on land and the ethics of men swimming for life in deep water, they may begin to realize why Germany and England are so fidgety and nervous.

The English, thanks to their insular position and the supremacy of their fleet, have hitherto been like men on *terra firma*. They have, therefore, acquired in the course of the last hundred years something of the American or *terra firma* ethical conception of international relations. It is otherwise with the Germans. Their empire is not yet forty years old. It has succeeded to the heritage of the ideas of the Hohenzollerns, who built up the kingdom of Prussia by the policy of Machiavelli, expounded and practised by Frederick the Great. No one can read such a book as "The Hohenlohe Memoirs" without feeling that Bismarck and the men who founded the empire were in the deep-water stage of ethics. They did not know what a day might bring forth. At any moment a combination of hostile neighbors or an internal revolution might bring to the ground the imperial fabric which they had built up with such infinite pains. To statesmen who go from day to day in peril of their lives, anything and everything seems justifiable that will weaken a possible enemy or destroy a possible danger. England was in that mood during the Napoleonic wars, when Pitt is said to have declared that whenever any European power built four ships of the line England ought at once to destroy them, lest they might at some future time be used against her. The classic illustration of this kind of preventive action was the destruction in time of

peace, without declaration of war by England, of the Danish fleet at Copenhagen. The British Government believed that the Danes, willingly or unwillingly, would be certain to place their fleet at the disposal of the French. Therefore, without ceremony, they swooped down like pirates upon Copenhagen and carried off all the Danish ships that were not sent to the bottom or burnt in the battle. It was the ethics of the hard-pressed swimmer in deep water, an ethic constantly acted upon by Prussian statesmen, from Frederick the Great to Bismarck. And it is this ethic of Copenhagen and of Silesia which explains all the hubbub which seems so unreasonable to Americans.

The English, as I remarked, have to a large extent developed the dry land ethics. But the Germans do not believe this. They know that they are still in deep water ethics, and they believe the British are no further advanced than themselves. The Germans know that if they were in the same relative superiority to the English at sea that the English are to them, they would long ago have swooped down upon the nascent fleet and destroyed it before it had time to grow strong enough to be a menace to their safety. And to this hour the Germans cannot understand why the English have not taken advantage of their overwhelming naval supremacy to send the German fleet to the bottom before it became too strong.

The German Emperor two years ago remarked to a friend of mine that there was a strong party in England that wished to take this course. When my friend disclaimed this as a monstrous imputation upon British good faith, the Kaiser remarked that he did not regard it in that light. On the contrary, he said, he could very well sympathize with these men, because it was natural that, having the power to ward off a possible danger, they thought it their duty to use it. That was a frank, characteristic avowal from the occupant of the throne of Frederick the Great. But it explains the present tension between the two countries. When I was in Germany four years ago, one of the most eminent of German professors and publicists told me that he never opened his paper at

breakfast without first looking to see whether Kiel was in flames and the German fleet at the bottom of the sea. When I protested that we were not pirates, he replied, "What you did at Copenhagen you may repeat at Kiel."

This deep, instinctive distrust of the English was strengthened by the attack upon the Boer republics and the fatuous folly of Mr. Austin Lee, at one time well known in Washington, but then Civil Lord of the Admiralty. An after-dinner speech of his, in which he comforted his hearers by the assurance that the German fleet, in case of war, would be sunk before breakfast, irritated the Kaiser and his subjects to madness. But it was madness which had much method in it. They deliberately set about building a navy which could not be sunk before breakfast. They are doing it now and they have been doing it ever since.

It may appear a paradox to the unreflecting that the more warships Germany launches the more nervous she becomes as to a possible English attack. But it is obvious that this is natural and inevitable. The power that has a two to one—to say nothing of a three or four to one—supremacy over another holds all the ships of the weaker power in the hollow of its hand. They are but hostages in the hand of the more powerful fleet. When Germany had no battle fleet to speak of she was practically invulnerable against England. Every new man-of-war she puts on the high seas *until she is in a position of naval equality* to England is the addition of a new hostage for her good behavior and as the addition of every new battleship is naturally regarded as a provocation and a challenge by the other Power, the Germans feel very ill at ease. They are in the position of a lion tamer who has for the time put his head into the jaws of the lion, and they never know when the brute may bite it off. Hence they are assiduous in giving assurances that their fleet building has no hostile intent, but they are still more assiduous in pushing on their ship building until they are in a position to contest with some chance of success the sovereignty of the seas which has been held so long by England.

The English just as naturally regard the growth of a powerful German fleet

within a day's steaming of their coasts with uneasiness. They do not for a moment credit the Germans with any fixt design to attack Britain or to dismember her empire. They know that the immense majority of the German nation is peaceful, sober and sane. But they know that the maxims of German statecraft, defined by Frederick the Great and practised by Bismarck, are based upon the ethics of the drowning man. They believe that if Germany ever found herself in the position which England now holds at sea the temptation to strike a deadly blow at a neighbor who, however friendly today, might be an enemy tomorrow, might easily become irresistible. Therefore they are disquieted—not by any means without cause.

If you in America think that John Bull has no cause for alarm, with the most powerful fleet he has ever seen growing up on the shores of the North Sea, you may reconsider that conclusion if you recall two salient facts. The first is that the regular army of Great Britain is 150,000 strong, whereas the Germans can summon to the battle line 2,000,000 trained soldiers. The second is that the British Empire floats upon the British fleet. The British Isles are fed from over sea. We are the imperial Venice of the world. Without the dominions over sea we are but forty millions to the German sixty. It is the sea and the sovereignty of the sea alone which maintain our empire. Hence the English feel instinctively that the moment any foreign navy comes near enough to endanger their supremacy the knife is at their throat.

When the present Government took office the British navy was nearly thrice as strong as the German. It is now about twice as strong. But in three years' time it will no longer retain that irreducible minimum margin of superiority. Before this year John Bull plumed himself upon his ability to build ships so much more rapidly than his neighbors that like the hare in the fable, he indulged in a comfortable nap. But again as in the fable, the tortoise forged ahead, and the hare woke up with a start to discover that he would have to put his best foot foremost if he were not to lose the race. What

he ought to have done when he made that discovery was perfectly obvious to every one who looked at the position from a patriotic or imperial point of view. He ought to have said nothing, but to have begun at once to build two ships for every ship the Germans laid down.

No one who casts even a cursory glance over the seven seas, which are all patrolled by the British fleet, can deny that a two to one margin of superiority is all too slight as against a possible adversary the whole of whose navy is massed within striking distance of the British coast, and which has behind the navy two millions of trained soldiers.

Unfortunately, however, the Radical wing of the Ministerialists, represented in the Cabinet by Mr. Lloyd-George and Mr. Winston Churchill, refused to recognize the life and death necessity of the two keels to one program. After prolonged altercation in the Cabinet, a compromise was agreed upon. To save the face of the malcontents, it was decided to announce that only four Dreadnoughts should be laid down this year, but that if circumstances necessitated further exertion, another four would be commenced. The Admiralty was given *carte blanche* to accumulate materials in the shape of gun mountings, etc., for building eight, but no vote was to be taken for more than four. It was a dishonest subterfuge, which entailed as an immediate result a stormy agitation in favor of a formal and immediate declaration in favor of laying down eight capital ships this year. For this irritating agitation the Little Navy Radicals were entirely responsible. Their leaders know perfectly well that the ships will have to be built if we are to maintain our naval supremacy and without naval supremacy the British Empire ceases to exist. But to save their face they insisted upon having their hands forced by a popular agitation which would enable them to profess that they had only succumbed to *force majeure*.

If the Government had quietly declared that they were building two keels to the German one, and would go on doing so, no matter how many keels the Germans laid down, there would have been no febrile, panicky agitation in this

country. As for the Germans, the bulk of them would have cordially welcomed a declaration which would have enabled them to demonstrate to their Navy Leaguers the futility of any attempt to outbuild the mistress of the seas. At present the advocates for unlimited naval expenditure in Germany have had as their great argument the assertion that England is feeling the pace too severe. "Only another spurt and the trident of the seas will be in our hands!" If they knew that the two keels to one standard would be unswervingly adhered to at any cost without even counting the cost, they would be only too glad to restrain their more bellicose fellows from persisting in this headlong race to ruin.

No one hates this war of armaments more than I do. No one is more profoundly convinced that the majority of the Germans desire nothing so much as to live in peace and friendship with Eng-

land. But in no way can we help the friends of peace in Germany to keep their Jingoës in check better than by maintaining without fuss and without fidget the two-to-one standard as the irreducible minimum of British security. That is less than the present *status quo*. We cannot allow that *status quo* to be modified to our detriment. That for us is a matter of life and death.

May I, in conclusion, put a searching question to your readers? Suppose that, by some convulsion of nature, Japan could suddenly be transported across the Pacific to within one day's steaming of your coast. Do you think it quite inconceivable that, under those changed conditions, some Americans might feel their nerves a little jumpy when they thought of what might happen? But Japan can never threaten the existence of the American republic as Germany can menace the British Empire.

LONDON, ENGLAND.

The House

BY CHARLOTTE LEECH

WHAT does he view, the passer-by?

By every human sign
A goodly habitation, but
I see a shrine.

He marks what may be bartered, sold,

Or changed, as are men's wares—
I see a tabernacle and
God's altar stairs,

With angels going up and down,

The loved and unforgot,
The dwelling, like the Patriarch's stone,
But marks the spot.

He notes the fragrant, grassy space,

A bright and heartsome sight—
I see a field whereon was fought
A mortal fight.

The goings out and comings in

Are seen of passers-by—
The doors close on the conflict, and
The tragedy.

The inmates, like a rosary

Held by the slender thread
Of lineage—what vows they have vowed,
What prayers have said!

Hearken, dear God, unite them in

Thy fair and far-off lands

Forever more in Love's Wide House

Not made with hands.

BROOKLYN, N. Y.

An Epoch-Making English Budget

BY FREDERIC C. HOWE, Ph.D.

[Dr. Howe, who sends us the following article from London, is lecturer on Taxation at Western Reserve University and on Municipal Administration at the University of Wisconsin. He is a member of the Ohio Senate and a special United States Commissioner to investigate municipal ownership in Great Britain. He is the author of "Taxation and Taxes in the United States under the Internal Revenue System," "The City, the Hope of Democracy," etc.—EDITOR.]

"A N Amazing Budget," "Drastic Proposals," "Plundering the Middle Class," "Attack on Capital and Industry," "A Penal Budget." These are the headlines with which the Conservative press and the land-owning classes have received the annual budget, which Mr. Lloyd-George, the Liberal Chancellor of the Exchequer, introduced into Parliament late in April.

The Liberal leaders, the land reformers and even the Socialists, on the other hand have hailed it as a "Great Democratic Budget" and "A Triumph for Socialism." Whatever may be the truth of these estimates of the partisan press, from the point of view of English history as well as the progressive movement in Great Britain the budget is a revolutionary measure. In its ultimate significance it is far more revolutionary than the historical budgets of Gladstone or the Napoleonic budgets of the first half of the last century. For this budget frankly announces a social program and boldly attacks the problems of land monopoly, unemployment and poverty itself. That it wholly satisfies neither the advanced Socialists nor the radical land reformers is but another evidence of the cautious manner in which Great Britain approaches all social questions. For nowhere in the world does the past cling so tenaciously to the present as it does in this country. Feudalism is so inwoven with democracy and the tentacles of the privileged orders are so universally pervasive that all legislation by whatever party introduced builds itself tentatively upon the old. Probably the quality of which Englishmen are most proud is the fact that they do not believe in abstractions. They do not care for mere ideals. They are not moved by principles. And they are inclined to distrust any people who are. They have always distrusted

the French, because they could not understand them.

The new budget is indicative of another fact, a fact which is true of America as well, and that is the gradual infiltration of socialistic or radical ideas into the whole body politic. Just as we find that radicalism is not confined to any one party or section of the country in America, but gradually permeates all classes, so in England radicalism creeps slowly along, making the program of socialism a very different thing from what it is in Germany and France.

In announcing his budget proposals, Mr. Lloyd-George committed the Liberal party to the following advanced program:

1. The extension of old age pensions.
2. The inauguration of a scheme of insurance to make provision for the sick, for the invalided, for widows and "for the broken soldiers of industry," the cost of which is to be borne partly by the State and partly by the classes directly concerned.
3. Some form of insurance against unemployment, trade depressions and industrial crises. The Chancellor admitted that this was a difficult problem, but that some plan should be worked out upon a trade basis and maintained by contributions from employers and employed and aided by the State.
4. The development of waste and sterile land, of which, any one familiar with England, knows there are millions of acres.
5. The creation of labor exchanges not unlike those in existence in Germany. For this purpose an appropriation of \$500,000 is provided.
6. Afforestation.
7. The organization and development of agriculture by the creation of a system of agencies for stimulating agricultural life and efficiency. For this an appropriation of one million dollars is provided.

But the acrimonious debate which has been precipitated by the budget is not due to the social program which it contains, so much as to the really revolutionary financial proposals which are involved. The privileged classes would

accept with tolerable equanimity the amelioration of industrial conditions if the cost of the betterment were to be borne by the laboring classes, by taxes laid upon the necessities of life. And it is not because of the program of social legislation so much as because of the method by which the reforms are to be financed that the Liberal budget seems to me to be revolutionary; for it strikes at the very root of caste and privilege in Great Britain by proposing the taxation of land values separate and apart from improvements thru three separate kinds of taxes. And the Chancellor himself in proposing these taxes defined them by words which might have been uttered by the author of "Progress and Poverty," Henry George himself. He said:

"The growth in value of urban sites is due to no expenditure of capital or thought on the part of the ground owner, but is entirely owing to the enterprising energy of the community. . . . "One disastrous result is that land which is essential to the free and healthy development of towns is kept off the market in order to enhance its value and towns are cramped and people become overcrowded in dwellings, which are costly without being comfortable. Land in the towns seems to be let by the grain, as if it were radium."

It is the proposal to tax "unearned increment" and unused land that has awakened the privileged orders and may result is as near a revolution as is possible in British politics. For the class division which is so obvious in this country is bottomed in the land. Nowhere in the civilized world does land enjoy a sanctity comparable to that which attaches to it in this country. It is an unconscious veneration and it affects all classes. And it is centuries old. France boldly destroyed the feudal system with the Revolution. Germany modified it and introduced small holdings thru the reforms of Von Stein and Hardenburg. By similar methods the other nations of Europe destroyed the old feudal system. But England is still feudal in its class distinctions to the core. Her land is almost all held in great estates. Four hundred Peers own over 5,000,000 acres. Twenty-seven and a half million acres are owned by 38,219 persons, while only 3,900,000 acres are divided among 217,000 persons. More than three-quarters of the entire land of England and Wales is owned by 1-785th part of the popula-

tion. Of the 32,000,000 of people in England and Wales, 31,000,000 are without any rights whatever to the land of the country. By means of the law of settlements and entails it is practically impossible for the land to be alienated from the great proprietors, who comprise the House of Lords and dominate the Conservative party in the House of Commons. The House of Lords is primarily a house of landlords. This is true even of the ecclesiastical peers, for the rights which the Church of England enjoys are also identified with the land.

The abuses which have been legalized by the landed classes in Parliament would fill a volume in themselves. The land has not been revalued for purposes of taxation since 1692. Its direct contribution to the imperial revenues is less than \$5,000,000. Since the seventeenth century four-fifth of the population has been driven to the towns, while great mineral resources have been developed, which have increased the value of the land a thousand fold. But the landed classes have prevented the reappraisal of their holdings and limited the taxes collected from this source to an insignificant sum, which was vouchsafed to the Crown at the time of the great revolution. The rejection of the Scottish Valuation Bill, the emasculation of the Small Holdings Act, the limitations placed upon the municipalities in their control of the slums and the tenement conditions are all traceable to a class instinct born of land monopoly, the like of which America does not know.

Between four and five hundred towns and local authorities have repeatedly urged upon Parliament the right to tax the land for local purposes; and the Liberal party endeavored to pass a land valuation bill for Scotland. But the House of Lords rejected the bill when presented to it. And the Liberal party has now adopted the only weapon in its hands for making a beginning in the correction of these century old abuses, identified with the exemption of land from any direct contribution to the local or imperial revenue.

Under the British Constitution the House of Commons has exclusive control of the budget. The House of Lords may not amend or reject it. For more than

two hundred years this right has been recognized. After three and a half years of fruitless land legislation the Liberal party has adopted this expedient for reaching it by taxation. And the proposals suggested strike at the economic basis of the British aristocracy. It has been intimated that the Lords might reject the budget and force an appeal to the country. Such an action would be unprecedented. It would be in the nature of a declaration of war by the privileged orders. The state would be left without revenues until the appeal to the voters could be settled.

A mere reading of the land taxes proposed does not suggest the revolutionary character of the budget, for the Chancellor only plans to collect about \$2,500,000 from a direct tax upon the land. His proposals are, *first*, to levy a tax on the increment of land which accrues to the land from the enterprise of the community. Twenty per cent. of the increase of the future is to be taken by means of a tax collected on transfer upon death or on sale. It is not proposed to touch the unearned increment already enjoyed. *Second*, to place a tax of one halfpenny in the pound, which is equivalent to an ad valorem tax of two mills per cent. upon the capital value, upon all land that is not used to its best advantage. This includes mineral resources and undeveloped city and suburban land. It does not touch agricultural holdings. Any land whose value is below \$250 an acre is exempt. *Third*, to exact a 10 per cent. reversion duty on any benefits which accrue to the owner upon the termination of a lease. When one considers that practically all the land in England is held by leasehold tenure; that the tenant makes all the improvements and that on the termination of the lease these improvements pass to the landlord without compensation to the tenant, the justice of this proposal seems obvious. Moreover, the majority of the leaseholds in the cities were made a generation or more ago. In the meantime the land has doubled, trebled or quadrupled in value. When the lease falls in the landlord not only acquires the improvements without cost, he enjoys an unearned increment in the nature of a "windfall" of which the state pretends to take but 10 per cent.

In order to carry out these proposals it will be necessary to value all the land in the kingdom. And this is more odious to the landed gentry than the tax itself. In the discussion in the House of Commons Radicals and Liberals alike asserted that this was but "the thin edge of the wedge," which would be driven in to the limit as rapidly as possible.

Nobody knows today what the land of England is really worth. There is no means of ascertaining it, and the land reformers claim that with the resources valued, with the colossal wealth of the landed classes laid bare, the task of gradually appropriating the present untaxed values for imperial and local purposes will become a relatively easy task.

In the debate in the House of Commons, which followed the introduction of the budget, it was surprising to hear many open avowals of the single tax by men in the Liberal party. There was no attempt to conceal their ultimate program. They would tax land not only for revenue, but to bring it into use. As the Chancellor of the Exchequer himself stated, "the dog in the manger must pay for his manger," if he would keep the land of England from its proper use. The Liberal party is saturated with the philosophy of the single tax. Campbell-Bannerman repeatedly advocated the taxation of land values. Over two hundred Liberal and Labor members of the House of Commons united in a petition to the Chancellor asking that an ad valorem tax of 2 mills per cent. should be levied on all land values, which would have produced probably \$175,000,000. Tons of single tax literature is distributed every year, and the idea that the land can be reclaimed to humanity thru taxing it into use and its most profitable use is one of the most definite as well as one of the most aggressive social issues in British politics.

Over 400 municipalities have organized into a great body seeking power to tax land values. They purchased tram lines, extended them into the country for the purpose of solving the housing evil, only to find that they had so increased the value of suburban land that it was prohibitive for building purposes. They were blocked in their efforts at housing reform by the untaxed land, which, close

up against the teeming city tenements, is used for sheep pastures. The Liberal party, which, in a historical sense, is the party of the trading and commercial classes, has been lured to this program by commercial interest and the decadence of British industry, while the growing body of radicals, who are moved by the appalling poverty of the country, see in this program a means of recalling the people to the land.

It is for these reasons that the budget is a revolutionary proposal. It may result in a conflict with the Lords and an attempt on their part to throw out the

budget—a thing which has not been seriously suggested for many centuries. This of itself may give vitality to the agitation, which now has little life, for the abolition of the Lords. If, on the other hand, the proposals of the Chancellor are incorporated into law, the program of the municipalities for the taxation of land values and of the Liberal party to appropriate "unearned increment" for imperial purposes will be open to trial. At any rate, the budget marks a most radical departure and stamps the new democracy of England with a distinctly industrial and social quality.

LONDON, ENG.

An Undesirable Citizen's Plea

"WHEN that I was a lyttel, tiny girl," it became my painful and solemn duty to trudge daily "down the lane" and "up the road" and transport for the family's need a bucket of milk. (The "bucket" was small and tin, but we did not use "pails" in our county!) On this pilgrimage I was wont to suffer much mental distress from the fear that I might meet a Cow, an unchaperoned, Horned Cow, seeking whom she might uplift. That a benevolent beast of the Cow family had furnished the milk for my "bucket" did not lessen my fear. Assuredly, none but 'moolley" cows are at large on the meadows of heaven, if my infant prayers were heard!

"Childish troubles soon pass by," but the fearsome Cow of my tender years confronted me again in Logic, being now reduced entirely to Horns and known as a Dilemma. I had the old uneasiness of spirit when we met, and the Dilemma was more persistent than the Cow. In one form or another, it stays with me. Dispense with the tail of Satan, if you will, out of respect for our Tertiary relatives, but keep the symbol of horns, for he attacks us in these strenuous days chiefly by perplexities.

There is roaming at large now a dilemma that has no terrors for me, but

is fraught with menace for others. Not for me, for when friends of former years greet me nowadays, they say not, "You have not married?" but, "So you never married!" and it has not the sting of a reproach, but the finality of an epitaph. Hence I can give the vexed question of matrimony impersonal, dispassionate study.

The way of the lone female must have been in the mind of her who wrote "Fightings and fears, within, without." Once it was not proper for her to support herself and not pleasant to rely on the support of relatives. She chose a horn—or a husband.

Then came a mild and almost "moolley" period. Have we not recently had with us writers who sought to portray, not the trials of true love, but the ease with which one might fall in love, marry and bring up an interesting family on an income that scarcely sufficed for the slippers and ties of the unwed? It was so easy and inevitable for the husband to inherit a house in the suburbs and form the habit of making the furniture at odd moments, and for the wife to find an intelligent girl with a ruffled apron and great culinary skill, none to help with the housework, so undisputable on paper, so passing strange in reality.

Alas, for this Ballad Age of home-

grown sideboards and edible pie! For it has been proved, scientifically and politico-economically, that woman, if unintelligent and untrained, should not marry, lest her children be incapable of the best development. And now the physiologist lifts up his voice to say that woman must refrain from education or she will have no children at all. In season and out of season, we are having this amazing truth thrust upon us: Those who are fit to rear children are not able to bear them, and those able to bear them are not fit to rear them! It is all proved, which makes it the more distressing.

Our melancholy deepens when, as sometimes happens, from the same mouth proceeds the statement that American teachers, because they can teach, are peculiarly fitted to be intelligent mothers, and the peculiar corollary that therefore they should never have taught, but should have married without more than a rudimentary education. The shape of his dilemma doth fall in upon itself. We remember "Epimenides the Cretan" and wish uneasily that we had not been told!

It was a relief to have our doleful domestic condition blamed on the tariff, for we women may say virtuously to our brethren:

"That one, dark, fearful burden, ye must stagger with alone."

We bit the apple, but we did not make the tariff! To perpetrate a tariff like ours demands a mind very clear as to industries and very murky as to infants; we have had a too uncertain grasp of the former and a too firm grip on the latter for such an achievement.

I might refrain from rushing in, after the manner of those not angels, had I not seemed to discern even in THE INDEPENDENT'S judicial tones a faintly reproachful accent when the lone American teacher was mentioned. It may indeed be true that, even when we strive to inculcate truth and cleanliness, the flag salute and the Gettysburg address, we are less profitable servants than Mrs. Minchowsky of Callowhill street, the mother of nine smudgy pillars of the republic who have hated instruction and have not obeyed the voice of their teachers.

But have we (this is editorial) refrained from marrying because we did not realize our duty as citizens? Have we chosen selfishly this path of easeful joy, this life that some writers are comparing to the monastic seclusion of the Middle Ages? Methinks I see a foe to matrimony, older than the tariff—and less subject to revision. It is the Fifth Commandment.

Teachers owe a great debt to a recently departed statesman. How often, when the psychologist has told me just what will budge Jimmy's obstructed will and rivet Gwendolyn's wandering attention, or when the educational reformer has assured me that all savage states but cannibalism must be passed thru by the growing boy, and yet heaven's first law be no less diligently enforced in the school room, how often have I murmured gratefully, "It is a condition, and not a theory."

Now it is a condition that somehow unites this question of matrimony to the Fifth Commandment.

In a neighboring town, Miss A. is teaching. She was a bright, sunny tempered girl, prettier than the average. Her curly, brown hair is still abundant and her eyes keep their smile, tho she has taught two decades.

She is the second of four children, one brother being older and a brother and sister younger. They had a shiftless father and a hard-working mother. When the children were quite young the father ambled off and never ambled home. From that time the burden of work fell heavily on the older girl. The brother helped, but when he grew to manhood and secured a good position, he married and established his own home, as a citizen should. The younger boy, shiftless like his father, was brought up by his sisters, and when he was finally propped into a position, he, too, married. The mother has been an invalid for some years. Her daughters, both wage-earners, care for her and support themselves.

Miss B. is the youngest daughter in a family of several girls and one boy. They were poor and were early left fatherless. The boy grew up reckless and dissipated. The girls made their own living and sometimes paid from their hard-earned

money to get the brother out of difficulties. Not long ago I talked to an old lady, who remembered when Miss B., a dainty, dimpled maiden, was shyly teaching her first term of "country school." She and a sister now maintain the home. The brother married.

The Misses C. had a kind, indulgent father and an invalid mother. Heavy financial reverses came to them. In early girlhood the daughters saw that their aid was imperatively needed at home. The mother died before the two younger brothers were grown. The sisters brought up the two lively boys and educated them. Incidentally, both girls put aside marriage. The men who wished to marry them were not, perhaps, able to face taking care also of the feeble father and the very not feeble boys. The boys are married now. The sisters are still wage-earners.

So the long catalog runs. The exception is to find among the rank and file of our teachers one upon whom some home is not dependent.

The claim of the Fifth Commandment seems always to rest more lightly on boys.

Out of one story might be made a tragedy, perhaps as bitter in its inarticulate way as the sorrow of Lear. One gives it in merest outline.

An ambitious boy, whose father was earning a scanty living on a small farm, persuaded the father to sell the farm, give him money for a college course, and embark in a small business in the small college town. The father tried to accustom himself to the new sort of work, but failed at it, went more and more heavily into debt, and, finally, the sorely troubled old mind gave way.

He was sent to an asylum, a State institution, but notorious for the cruelty with which the poor sufferers are treated. Soon the old man was brought home—dead—his body beaten and broken by untold cruelties.

The son prospers. He married before his father died, and he has purchased a good home. Built on a strange foundation—a father's broken life. One wonders whether it will stand. Not long ago I passed him, and a baby's round brown eyes smiled up at me from the go-cart he was wheeling. Well, he is

meeting the tests of citizenship better, of course, than a mere woman could—and one could not wish ill on a baby!

The community does not judge the son as it does the daughter. I know a family of six—three boys, three girls. Two girls married, and the boys have sought their fortunes from sea to sea. Then the oldest girl married; and the disapproval of the "neighborhood" was comical. "What will they do without her?" said "everybody," severely. Nobody wonders what a family will do without its sons.

Does somebody ask whether solving the servant-girl problem will not avail to send the daughters away as freely as the sons? No; we have already solved the servant problem by eliminating the servant. Nor do we need to be told how to live on \$1,200 a year and still give an occasional pink luncheon or green tea. The social dissipations of the average teacher could hardly be marked down any lower than they now are.

The teachers of whom I have written were not hampered by college education, nor had they any yearning for a "career." With them teaching was simply doing the nearest duty as they saw it. One hears much about men who cannot afford wives; these are the women who have never been able to afford husbands.

Are they typical? In the average town of less than twenty or thirty thousand, I believe they are. From my own small acquaintance I can name twenty, thirty, and more, who are in the profession, making up for the financial or moral deficiencies of the men of their families, making up for reverses caused by illness, or for need brought near by death.

And the daughters of "mine own people" are proud to stand by their homes. "Isn't it lucky that I didn't go back to college!" said a young teacher to me almost gayly, when the family fortune had gone West in the pocket of a bank cashier. Their help is gladly, generously given. But with what justice is it said that, because the claim of the old home was stronger than the call of the new, they chose the easier part?

These things do not appear in statistics. One does not verify them by neatly printed lists of questions sent out by the thousand. Even—one says it with

bated breath!—the superintendent cannot always ascertain the facts. Also the eminent educator who “voices the sentiments of the teachers of this commonwealth” (and sometimes they do not know their own voice!) knows almost incredibly little about the lives of the teachers.

Do these women, businesslike, cheerful, even light hearted, it may be, ever wish that they, like their brothers, had been free to go, make homes, rear their own children, and win even from our ex-President a civic crown?

That is their secret! We know that many a mother has less of love for her children than some of these who have the childless mother heart. We know that many a voter knows less of his country's history and cares less for its ideals than do these home guards of the school room.

Let no one think that I would attack

the old, old fashion of marriage, to which we are all indebted. If, to perpetuate it, we need to call the spirit of patriotism from the vasty deep of human motive, let it be called. Perhaps the biscuit of inexperience will be more valiantly eaten and the sock of erstwhile bachelordom more resignedly darned, when both deeds are done for the glory of the Republic.

Dulce et decorum est pro patria in matrimonium ire! But let not the brethren darken counsel by too many kinds of advice. Were there an exodus of women tomorrow from the ranks of teachers, who would fill the places? Shall motion songs and infant phonics be added to the white man's burden? And if the task of polishing Cornelia's jewels were given to him, would he learn, at last, that, to our common country,

Life may be given in many ways.
So bountiful is Fate?"

The Standards of the University

BY DAVID STARR JORDAN, LL.D.

Author of "The American University," "The American Teacher," etc.

WITHIN the last few years we have heard a good deal of the breach between professors and students, the growing divergence in their tendencies and points of view, and the dire evils to which this divergence may lead.

This has not been a matter of one university alone, nor in any important degree. In so far as the matter is real, it affects all our universities alike. The universities of America are all young; not one of them has attained its growth or reached its majority. Thus all are afflicted at about the same time with the same growing pains, the same aspirations for change and improvement, and the same children's diseases and complaints of adolescence.

Harvard University is the oldest and best established of the group. She usually feels these attacks first, and is therefore the first to recover. For this reason,

and still more on account of the masterful personality of Harvard's president, all the other American universities have come more and more in all things to pattern after Harvard; a long way after, sometimes, but in all cases the effort is evident. The final result is that, in spite of the multifarious variety in their origin and support, and in spite of the bursts of originality of Cornell, Johns Hopkins, Wisconsin and Michigan, our American universities are amazingly alike. This is true both of their strength and their weakness. They have the same entrance requirements, the same requirements for graduation, the same clumsy ways of measuring attainment, the same overweight of student activities and newspaper notoriety, the same type of teachers, trained in the same methods and in the same libraries and laboratories. These, too, are impartially underpaid, without adequate distinction between

those who are professionally and intellectually leaders in civilization and those who faithfully, or even unfaithfully, hew wood and draw water.

For all these reasons, when an adverse wave affects one institution it affects all the others. Just now the adverse wave is that of the divergence of the student body from academic standards. From this has resulted a disposition to take stock of our purposes and ideals, to reconsider the degree to which these ideals have been made clear to students, and to determine whether, in our zeal for university advancement, we have not neglected unduly those for whose benefit this advancement was to be made. In other words, in our eagerness to train the graduate student, have we not neglected the freshman, without whom there would never be any graduates?

In so far as this is so, and it is everywhere true, the blame must finally fall upon the teaching body. In the hands of the teachers alone the remedy must lie. The student body is in the long run plastic in its hands. If a part of the student body is indifferent to intellectual work or hostile to it, after a fair trial, it is the duty of the teachers to eliminate all such individuals as having no place in the university at all. For the rest, it should exact and accentuate the ideals of scholarship and diligence, that the student, realizing their nobility and worth, may find thru them his "heart set in flame."

As university teachers, we have toward the advancement of knowledge a duty which is most insistent, and one which we cannot neglect if higher education and higher culture are to remain part of our heritage.

On the other hand, the university teacher has toward his students a duty equally insistent, and one which is all essential to the life of the university.

I have had occasion more than once to quote from the striking essay of Uchimura on the higher education in old Japan:

"Our teachers knew each one of us by name. We did not call them by the unapproachable term 'professor.' We called them *Sensei*, those born before.

"We were not taught in classes then. The grouping of soul-bearing human beings into classes, as sheep upon Australian farms, was

not known in our old schools. Our teachers believed, I think, instinctively, that man is unclassifiable; that he must be dealt with personally—face to face, and soul to soul. So they schooled us one by one—each according to his idiosyncrasies, physical, mental and spiritual."

And this brings me to the point of my present discourse. In the American university it is all important that the teachers should know the students, individually and collectively—their hopes, their aspirations and their achievements. The chief reason for this is that the students may likewise know their teachers, that they may understand that these also have hopes, aspirations and purposes, representing the noblest outlook of the university man. The immature men must learn the higher standards and the higher purposes of those more mature, that their own lives may be planned in nobler fashion. We hear a great deal in these days of college spirit, of student loyalty to the college life and college traditions; but these have no value outside of their intrinsic worth. There can be no loyalty to the college or the university without loyal devotion to the highest for which the college or the university stands.

President Hadley has said that the first business of the university is to set standards. This seems a simple word—an easy thing to say—but it is the most important of all matters in university development. It is the duty of every university teacher in his degree, individually and thru team work, to set standards of living, and thinking, and feeling, and acting, so that the student who knows him well will be by that fact insensibly drawn higher. It should be his duty, his spontaneous habit, to act as a representative of the best things in life, wherever these may be found. A representative of the second best, conscious and satisfied with his part, ought to have no place in the well-ordered university.

A university faculty which does its part toward the students under its charge will be at once friendly and severe. It will be friendly toward the students as men and women, patient, helpful, long suffering, as becomes men who have taken the vow of poverty to redeem the intellectual world. It will be severe, never satisfied with poor work or vacillating action or a line of conduct not guided by moral principle. It will for-

give the individual for many lapses of mind or behavior, but it will not condone the habit which the lapse involves. In other words, in all matters relating to symmetrical and wholesome growth, the university will maintain standards, sternly, severely, and without compromise. The teachers will know the students, will call each one of them by name, that the students may in turn know the teachers for the best which such acquaintance may bring. If to know his university teacher well does not mean much to a young man, either he or his teacher (possibly both) is out of place in the university. The university and the college should have different functions, and these functions appear in the lives of the teachers.

The purpose of the college teacher is by means of mental training and moral inspiration to make men out of boys. The university teacher has the duty of training men thus made for professional and social service. As our universities and colleges are today organized, these two duties and two types of men are not separated. The teacher has for one hour a university purpose; for the next, his life is wholly absorbed in the duties of the college.

To make men and women out of boys and girls, to develop good character and good citizenship, to create sound fiber, moral, mental and physical—this is the business of the college teacher. To this end, he knows no better way than to keep the student in the spirit of continuous effort, to give him hard work and plenty of it, that he may come at last to joy in work, to value his time for the chance it gives for effort.

And right here is a growing abuse of our college system, not new to our time nor yet to our country. The college life is on the whole a most joyous kind of existence, even when it is also a strenuous one. There are many who would like the joyous position without the strenuous. There are many men in our colleges to whom a good time is the whole thing, and the drill and effort the college aims to provide constitute merely an incidental nuisance.

It has been gravely argued, in England, that we should not insist on high scholarship as a necessary character of

the colleges at Oxford. "Oxford should be rather a place where young men of good families may sow their wild oats, with the least possible danger of personal injury."

There have always been idlers and rakes in every college, but until lately they have rarely claimed to set the pace. They have gone their way, but with a half apology from themselves and their friends. Now, in some quarters, these claim to be the college. They show the contempt they have always felt for the dig and the grind, for the man who tries loyally to gain from his college life the best that the colleges have to give.

Palaces have been reared for the "tender rich," as Charles Eliot Norton used to call them, and provision has been made for their grooms and their grooming, that the forms of the college may be preserved, even where all semblance of intellectual effort or of moral stamina has been abandoned.

It is perhaps true that training schools should be established for men of this type, as Downing College was once built for them at Cambridge, in England; but these institutions should not take the name of "college" or "university," names long sacred to intellectual effort and moral uplift. A better name is "sanitarium," or, if idleness be not regarded as sanitary, one might call them by the non-committal name of "resorts."

The professors should know their students, not for the men they are, but for the men they ought to be. It serves no great end for the professors to gather in the men for purely social purposes, nor for the purpose of ingratiating themselves by baby talk on football and track possibilities. It is no part of the professor's duty to coax or court student popularity. Smokers and afternoon teas count for nothing unless there is an ulterior purpose to make them worth while. To ingratiate one's self with the boys is worse than useless, if the purpose and result is not moral and mental uplift. To have "drunk from the same canteen" is to bring men together, if the fellow feeling is an incident of the march—if the men who drank together were striving together as well. To drink from the same beer keg, when there is no common uplift or common effort, does not

tend toward warmer friendships or higher standards. "The difference in the morning" is the test by which the comradery among free spirits, "*Gemeingeist unter freien Geistern*," may be distinguished from its many imitations.

The divergence between professors and students is therefore, in the long run, and in all cases, the measure of the laxity of the professors. If the professor upholds the standards entrusted to him, the student will respect these standards and will respect him. The snap course is disposed of with a snap of the finger. It is not the teacher who gave us an easy time whom we remember with gratitude. It is the teacher who helped us to find ourselves. To help us to find ourselves, it was his part to come very near to us, but without compromise, without apology, without yielding a single point to our weakness, our ignorance, or our vanity.

Robert Louis Stevenson has a fine passage on the good things in life, one of these being the power to hold a few friends, and these "*without compromise*." He was to remain Robert Louis Stevenson thruout these friendships. He was

to abate none of his opinions, his principles or his chosen lines of action to come close to these fellow spirits. And this, as college teachers, must be our attitude toward our younger fellow students. We must draw them to us, because we represent the standards they hope—vaguely, no doubt—to attain. These standards must be kept in sight, sharply and severely maintained. And finally, so far as may be, traveling the same road together, with like aims and like aspirations, we must hold them as our friends, and our friendship, like our exactions, must be "without compromise."

If the university be really worth while, as men thru all the ages have deemed it to be, it must be upheld in all its strength and in all its beauty. Its kindliness and its exaction should be as the goodness and severity of God, and it is not for us, its chosen defenders, to abate one jot of either in preparing our successors to continue its ideals and its work.

Of the many things you have learned in the university, let the spirit of this line of Tennyson be one of the most abiding:

"It was my duty to have loved the highest."

STANFORD, CAL.

The Solid South

BY LUCIUS F. C. GARVIN

[An editorial last week discussed the disintegration of parties and called for a realignment along actually existing differences of policy. The following article by an ex-Governor of Rhode Island further develops the subject.—EDITOR.]

PRESIDENT TAFT is trying to disrupt the politically Solid South. In this he is representative of the leaders of the Republican party.

It may be of interest to learn the view of a Northern Democrat upon the matter. Thomas Jefferson express his surprise that democratic principles took root in the South rather than in the North. Ever since his day it has seemed increasingly strange that "equal rights to all and special privileges to none" should have received more support among slaveholders and their descendants than with

the "mudsills" of New England and their offspring.

At the present time signs are not wanting that the extension to the Southern States of industries long established north of Mason's and Dixon's line has carried along with them a tendency to like political conditions. Mines in West Virginia and factories farther south are reproducing the politics of Pennsylvania and New England. Recent proof of this is to be found in the vote sustaining Speaker Cannon's program of tyranny and Senator Aldrich's removal from the

free list of the raw materials placed upon it by the House of Representatives.

Every year shows an increase at the South of a sentiment favorable to "protection," a policy which is the embodiment of special privilege. "Protection" and democracy are contradictory terms, each exclusive of the other.

Under a government by parties, such as ours unfortunately is, there ought to be a distinct line of cleavage in opinion between the party in power and the Opposition. They should not merge into one another in such a way that honest men holding the same views can belong indifferently to either. From this it follows that a Republican removing to the South cannot consistently become a Democrat in national matters, and *vice versa*. Again, a sectional division of parties is *per se* harmful.

That a majority of the voters of any State should cling to a party, altho holding the views of its opponent, because of some outside pressure, such as apprehension of the negro vote, is also highly objectionable.

Furthermore, it may be said that the Solid South has aided in solidifying the North. Partly in consequence of this, the Republican party elects its President and its Congress more surely at each successive trial.

It is true that the chief reason why any party is permanently dominant in a State is that it possesses more of the sinews of war, money, than has its opponent. It is likewise true that the supremacy of the wealthy party in the several States is extending naturally and logically to the nation. Indeed, it is an open question whether a free government can long be maintained with the great mass of the voters poor and dependent on a living mass of the few rich.

In any event, the solidification of the powerful North on the one hand, and of the weaker South on the other, makes any real combination of the people against the money power much more hopeless.

My conclusion, therefore, is the same as that of President Taft. Whenever any or all of the Southern States accept the doctrine of the Republican party, that the Government should take care of the rich and the rich take care of the poor, then they should cease to elect Democrats to Congress or cast their electoral votes for a Democratic candidate for President. The States which seem to be leaning toward the party of special privileges and unequal rights are Delaware, Maryland, Kentucky, Tennessee, West Virginia and Louisiana, with Missouri, North Carolina, Georgia, Virginia and Alabama squinting in the same direction.

The lodgment of half a dozen of the distinctively Southern States in the open arms of the Republican party would make the policy of "protection" so strong that no concessions to consumers would even be considered by Congress. Under that condition of things, it is conceivable that there might arise a Democratic party consistently advocating the only real alternative to the policy of a tariff upon imports, to wit, the sweeping away of custom houses altogether. This is the direction in which the British Parliament, under the leadership of Lloyd George, is now heading.

The most promising outlook for us is that, thru a revival of the Jeffersonian doctrine of equal rights and no monopoly, a party may spring up which, really believing in free men, free trade and free land, will redeem the United States from its present status as a plutocracy.

—LLOYD GEORGE.

Literature

New Novels

A DESIRE to perform feats with his gift often leads an author astray. This may explain why Mr. Bacheller put a short, purple-bordered robe on his genius not long ago and wrote "Vergilius." Mr. Bacheller was led into this error by his power of enchantment with words. His descriptions were sensuous and fascinating, but if an author casts the scene of his story far enough back in time he has only to write of things literally in order to produce the most startlingly romantic effects. This is why it was a waste of precious talent for him to have written where incantations were not necessary. But in his last book¹ he has returned to his earlier manner and has written with the same sweet wizardry that made "Darrel of the Blessed Isles" one of the most delightful spells ever cast by an author in fiction. This is the more remarkable because the railroad financiering upon which his new story is based depends largely for its interest upon dollar-marked material, out of which so many commonplace commercial novels are figured. In *The Hand-Made Gentleman* he portrays in a charming old motto style what a man may make of himself who earns a freshet of money and studies his dictionary and "The Letters of Lord Chesterfield." The book is likely to prove popular with the capitalists, since the names of many famous rich men like Commodore Vanderbilt appear in it with admirable delineations of character. The story really illustrates the heroism of those men who supplied the brain and machines by which the one-man power is being so rapidly supplanted, and it appears that the author is on the side of the machine—one of those unscrupulous, poetic lovers of power and of the brains that manage power.

Morley Roberts has never been a discreet writer of fiction and in his last book² he has cast lady decency to the

winds and has said whatever came into his mind to say. The effect is startling, to say the least, and he has produced a strong, bad book, which women will not read, a difficult thing for a writer of bad books to accomplish. Meanwhile even eminent male critics praise the book highly. The scenes are laid as usual in a Scottish fishing village, and the characters are all rugged fisher folk. Young David Bran is the hero, and in the life of this man Mr. Roberts undertakes to prove the proposition that every man requires a wife and a mistress in order to fulfil the needs of his nature and to insure the whole of happiness. He does not state his proposition in so many words, but he dramatizes it with a strength and ability that leave no room for argument. The question to be decided is whether it is good for a man to have all he wants. Nature is a curious old harridan in some ways and has no scruples about leading a man back by his instincts to the place from which we have had great difficulty in bringing him up. The wild ass may be a picturesque animal and doubtless has all the needs of his nature satisfied, but, properly domesticated, he is safer and more serviceable to society. The same commentary fits a man like David Bran. He is attractive to good women because they do not understand him, and to bad ones because they do, but enough David Brans in any one neighborhood would degrade it a thousand years deep in one generation. Another characteristic to be expected in such a story is that David Bran's mistress is the alluring, brilliant, generous, great woman, and the wife is merely good and the mother of his children. Morley Roberts belongs to that class of writers who know how to give wantonness the grace and glory of virtue and how to give virtue an idiotic stare.

Frank Danby has given everybody in her new novel as much pain and trouble as they can bear. Sebastian is the son

¹THE HAND-MADE GENTLEMAN. By Irving Bacheller. New York: Harter Bros. \$1.50.

²DAVID BRAN. By Morley Roberts. Boston: L. C. Page & Co. \$1.50.

SEBASTIAN. By Frank Danby. New York: F. Macmillan Co. \$1.50.

of a literary woman who disappoints her ambition, break his own heart in a miserable marriage, and deter happiness for all who are connected with him. He is one of those good men whose goodness renders them tragically disappointing in life, as if some fiend took advantage of their noble helpfulness. For a change the reader may try Alexander Otis's new story,¹ which he claims is a novel of love and laughter. It is a pleasant comedy of errors in which a dramatic critic finds himself not only in an Episcopal minister's shoes and frock coat, but in his pulpit as well. His effort to measure up to the moral emergence of the situation is not only diverting, it is suggestive of the difference between the week-a-day and Sunday mind of the average congregation. They resented from the pulpit points of view they would readily have accepted across their dinner tables. The dartings to and fro of the critic in his efforts to escape an intolerable situation, the rage of the deposed clergyman, the wit of the girl who is the trump card of fate in the story keep the reader's attention like watching a lively game.

Novelists do not appear to be so successful when they lay the scenes of their stories in Northern Africa as when they trek across the lower part of it with the Boers. Irene Osgood's tale of the slavery of a young English nobleman who was captured by brigands in Algiers reads as if it had been written during her senior year at a young lady's seminary.² And Eugene Paul Metour's story of war and adventure in Morocco is more interesting only because he has created a very false and tempting lady in the course of his narrative.³

The sketches that compose Mr. Joseph Lincoln's new volume⁴ have appeared from time to time in that class of magazines designed to make the home "bright and beautiful." In this present form they make an interesting memory book of New England customs and scenes, and should be very popular with read-

ers who are familiar with the New England of a former generation. Mary E. Waller's latest volume is also a memory book,⁵ with a hero in it, as every woman's memory book is bound to have. The year out of life referred to in the title was spent in Germany when she was a young girl. And the hero was a German who afterward became a great man, and with whom she exchanged the letters that compose this volume. One is inclined to suspect that they are make-believe letters, the male and female of them is so much alike and they are too deliciously literary in flavor. Lovers do not as a rule choose such excellent thin, thought-colored words. But the book is refreshing, like the home-made ale and nectar that women sometimes brew.

Studies in Mystical Religion

ONE great and at first sight astonishing effect of the overthrow of the older theology by science is the revival of interest in mysticism, and a consequent output of books on this phase of religion. It would have seemed incredible to Darwin, Huxley and Tyndall if these conscientious scientific explorers had been told that they were blazing the trail into new fields of religious life and thought, and yet the natural concomitant of the demand for facts, for first-hand experience in the realm of science, and of the overthrow of authority and tradition in all fields of human knowledge must in the domain of religion and theology be a return to mysticism. It is this aspect of mysticism that is chiefly emphasized by Dr. Rufus Jones in his *Studies in Mystical Religion*.^{*} By tracing the history of the various mystical movements which from time to time have made their appearance within the Christian Church or—in the case of the Greek Platonists and Neo-Platonists—outside its limits, he shows that there has ever been a tendency to return to first-hand experience, and to demand that religion be living and interior, rather than a species of magic wrought by means of external forms and rites which could only be performed by an ordained priesthood.

⁴OUR VILLAGES. By Joseph Lincoln. New York: D. Appleton & Co. \$1.00.

^{*}A YEAR OUT OF LIFE. By Mary E. Waller. New York: D. Appleton & Co. \$1.00.

^{*}STUDIES IN MYSTICAL RELIGION. By Rufus M. Jones. New York: The Macmillan Company. Pp. xxviii, 318. \$1.50.

Among recent books on the subject, Dr. Jones's volume is pre-eminent for its clear, sane and sober criticism of the various aspects of mysticism. Modern psychology has done much to clear away the superstitious traditions that have collected around many of the outstanding mystical saints. The phenomena upon which so great a value used to be placed as signs of holiness and of the favor of God, are now explained in terms of hysteria and auto-suggestion. The gift of tongues, which was one of the earliest of these phenomena in the Christian Church, is beginning again to be ranked as Paul valued it when he told the Corinthians that he had rather speak five words with his understanding, than ten thousand words in a tongue. The stigmata of St. Anthony or of St. Catherine no longer seem miraculous to the student of nervous diseases, and religious ecstasy is not a phenomenon explicable only in terms of the supernatural. These marks of holiness are coming now to be recognized rather as the disadvantages of the mystical temperament, than as essential to mystical religion. They are not the essence of mysticism, nor is the true mystic a recluse or a hermit a man engrossed in his own spiritual life to the exclusion of worldly interests and duties. Dr. Jones points out that the great shortcoming of the many of the mystics of the Roman Catholic Church was that their mysticism was a solitary path which the soul traveled by itself alone.

From such mysticism as this, which, while infinitely higher than the preoccupations of the world outside, was, after all, only spiritual selfishness, Dr. Jones traces the upward course of the mystics thru the many movements of revolt against the accumulating evils of the Papal dispensation to the Reformation and to those efforts after spiritual religion, which in England especially were needed to complete the work of the Reformation. The volume is written as preparatory to a history of Quakerism, and the bias of the writer in favor of this modern society of mystics is nowhere concealed, tho the founders of Quakerism are not included in Dr. Jones's history. The principal heretical movements of Christianity, from the

Montanists to the Ranters, are reviewed critically yet sympathetically, and tho there are many pages of somewhat abstruse and difficult theology, the greater part of the volume could be read with interest and profit by any one who cared to learn something of the story of the Christian Church, even if he were not especially interested in either theology or mysticism. The outstanding feature of Dr. Jones's history is the enormous advance that the world has made in Christianity since the Reformation. It was almost at the end of the sixteenth century when John Rogers wrote his book on the wicked heretics known as the Familists, whom he describes as leading a good and holy life "as a cloak to hide their gross and absurd doctrine"; and four centuries earlier, in exactly the same spirit, heresy hunters were told to suspect heresy whenever they found people leading lives of extraordinary purity and simplicity. And if the story be traced to much more modern times, we are compelled to realize that scarcely a century has passed since civilized mankind has begun to rank a good and honest life as of more importance than correct theological doctrine.

The Government of European Cities. By W. B. Munro. New York: The Macmillan Co. \$2.50.

Tho the framework of the government of European cities was adequately described by Dr. Albert Shaw two decades ago, and has since been frequently examined, yet American interest in the technicalities of their government is unabated. Dr. Munro's work, scholarly, full and clear, should satisfy curiosity as to British, French and Prussian municipal methods. He says little of the fruits of these methods, and thereby escapes the controversy which might mar his academic calm. Americans have more faith than Europeans in alterations of machinery for producing better government. Therefore the Galveston idea, the Des Moines plan, attenuated councils, glorified mayors, bicameral and unicameral systems—every device conceivable—are all tried in turn; while England and Prussia, and, to a lesser degree, France, plod on decade after decade, winning high class government thru a machinery

that, tho often illogical and cumbersome, is seldom changed. Their one supreme distinction is that they secure the services of honest, devoted, able men as councilors and executives. Whether they be unsalaried, as in England, or partly salaried and partly honorary, as in France and Prussia, whether the terms of office be long or short, the central control, feeble or rigid, and the spirit bureaucratic or democratic, always the decisive fact is that the men who undertake the duties are not "working for their own pocket all of the time." No city in the countries described in this work possesses a counterpart of our unique municipal product—the boss; because nowhere do the spoils belong to the victor and nowhere is the party system complete and omnipotent for city affairs. Tho in no case are the employees appointed by civil service examinations and protected by law against removal, yet in all cases they have practical fixity of tenure during efficiency and good behavior. That is the standing wonder of European governments. Why does not some Irishman avenge the woes of Erin by organizing a political machine in London and, taking advantage of the liberal laws to gain control of the offices, give the detested Saxon a dose of Tammany methods?

Christ and the Eastern Soul. By Charles
~~William Hall~~ *George*. The University
 of Chicago Press. \$1.25.

President Hall, of the Union Theological Seminary, proved so acceptable to both Christian missionaries and followers of Oriental faiths when he delivered his first series of Barrows Lectures on the Haskell Foundation, by appointment of the University of Chicago, that he was prest to acceptance of a second appointment. This volume is the result. It cost President Hall his life, since he never recovered from the illness which began before his return from India. This fact lends a pathetic interest to his endeavor to persuade the men of the East that it lies in their power so to mold and interpret Christian truth as to increase its beneficence and power in the modern world. "At this juncture," he urged, "one thing is needed above all else for the religious development of

the human race: the influence of the Oriental consciousness for the reinter-pretation of Christianity to the modern world. . . . The Oriental consciousness has the gifts that the world needs to offset its strenuous externalism and guide it back to the secret place of the Most High. The contemplative life, the presence of the unseen, the aspiration for ultimate being, reverence for the sanctions of the past, are the four Gospels with which a Christian East may re-evangelize the West; giving back to it the spirit of the first days; co-operating with it to lead the world out of its confusion, grossness and sin, into the peace and purity of Jesus Christ." One difficulty with this view lies in the fact that the East had the Gospel once, and the degenerate Eastern Churches are the result. Christianity found its power only in the hands of the strong peoples of the West.

The South African Natives: Their Progress and Present Condition. Edited by the South African Native Races Committee. New York: E. P. Dutton & Co. Pp. xii, 247. \$2.00.

The South African Native Races Committee, in 1902, published the results of a long and careful inquiry into the economic and social conditions of the natives of British South Africa. The present volume is a supplement to the "Natives of South Africa," and covers the changes and progress that have been made since the close of the Boer War. The committee from the first has been sympathetic with all that makes for the improvement in education and in economic status of the colored races who form, and will inevitably continue to form, so great a majority of the population of the British colonies in South Africa. In the present volume they are able to take a hopeful view of the general trend of affairs in these colonies. They write in the introductory chapter:

"A new spirit of progress is abroad. The natives begin to do something for their own improvement. They value education more than they did. They have opened schools. They have their own newspapers and their own political organizations. Along with healthy, tho sometimes misdirected, activity is a growing power of initiative—a source of anxiety at present, but of promise for the future." Cape Colony has always pursued the

most liberal policy toward the natives; and it is in Cape Colony that the native question gives least concern. Only in Cape Colony do certain natives exercise the political franchise. It would not be possible or desirable to extend the franchise to natives in those colonies where they largely outnumber the whites; but, in the opinion of the committee, some small degree of responsible local government might be granted in all the colonies as soon as the colored people begin to adopt civilized habits and to acquire the rudiments of education. As has always been the case, Natal lags behind all the other colonies in her attitude toward the natives, and yet in no colony is it so important to the life and safety of the white inhabitants that the natives should be contented and should progress in civilization. In Natal the natives outnumber the whites ten to one, while in Zululand the disproportion between the races is even greater; and yet, so far, the Government has done little to help the natives or to counteract the disintegrating forces of civilization, which have broken up their tribal life and their tribal codes of morality. Repression and an almost wanton increase of taxation brought on the recent rising in Natal; but this rising does appear to have brought home to the colonial Government the danger of living above a seething mass of discontented and disaffected natives. It is inexcusable that such a condition should continue, for the South African native, under his own code of morality, is law-abiding, truthful, and, when fairly treated, has never shown himself ungrateful or unwilling to work. The authority of the elders and the submission demanded from the young have produced in the raw native remarkably fine and dignified manners, and it would be deplorable indeed if the only effect of white influence should be the disintegration of his code of morality and the demoralization of his character. In order to prevent such a misfortune, the committee strongly urge on the South African Governments a more hearty co-operation with the missionaries. An excellent account is given of the various missions which are being carried on in the different colonies, special praise being

bestowed on the Paris Evangelical Mission in Basutoland. A sympathetic and discriminating survey is also made of the Ethiopian movement and the connection of the native churches with the A. M. E. Church. Altho this work has suffered from the unwise zeal of some of its advocates, the committee consider it a natural outcome of native energy and initiative, and not in the least likely ever to acquire strength or cohesion enough to threaten in any way the domination of the white races.

✱

Cylinders and Other Oriental Seals in the Library of J. Pierpont Morgan. Catalogued by William Hayes Ward. Quarter, pp. 129, with 39 photogravure plates. Privately printed (250 copies) by Frederic F. Sherman, New York.

This volume contains heliogravure plates of 310 Oriental seals, mostly cylinders, comprising a collection lately acquired by Mr. J. Pierpont Morgan, and described by Dr. Ward. Mr. Morgan is not only president of the Metropolitan Museum, but is himself a collector of the choicest objects, and has shown an interest in the ancient remains of Western Asia, such as Babylonian tablets, statuary and seals; and several volumes, privately printed, have already appeared describing his treasures, which are gathered in his library and are made accessible to scholars. The illustrations in the present volume are made from gutta percha casts, and are more accurate than any drawing. The text consists of an introduction somewhat fully describing the character, use and distribution of these seals over the region from Persia to the Mediterranean and Egypt, and a classification of them by periods and nationalities. The mythological figures on the seals are identified as far as possible in the several descriptions. This collection is unusually rich in the Syro-Hittite class, and there are some designs of the greatest rarity and importance. The book work has been brought to ultimate perfection by Mr. Sherman. The printing is from a new font of old style caslon type, and the hand-made paper was specially manufactured in France for this book. We presume copies will be given to selected libraries and scholars.

Literary Notes

....The City Library of Frankfort a.M. has secured 38 hitherto unknown letters of Wilhelm von Humboldt, dating from 1796 to 1803. Of these 36 are to Schiller and the other two to Goethe.

....The third completely revised edition of the greatest thesaurus of Protestant theology extant, the famous Realenzyklopädie für protestantische Theologie und Kirche, founded by J. J. Herzog, has just been completed under the editorship of Prof. A. Hauck, of the Leipzig University, and published in twenty volumes by J. C. Hinrich, of Leipzig. The first volume of this edition, to which the leading theologians of Germany contributed, appeared seven years ago.

....It was the custom of the late Charles Cuthbert Hall, when a pastor in Brooklyn, to arrange a special church service for children, with music of the best quality and a sermon carefully prepared. His spirit was so gentle and his mind so simple that these sermons were well fitted for their purpose, and enjoyed by older members of his congregation as well as by the younger. A number of these sermons to children are published under the title of *The Silver Cup* (Houghton-Mifflin Co., \$1.25).

....The most valuable ancient Indian collection of books ever brought to Europe was recently secured by the antiquariat of Karl W. Hiersemann, of Leipzig, and consists of 763 manuscripts on palm leaves, comprising in 1,287 works the whole Sanskrit literature of the Vedic and later periods. The manuscripts are from 150 to 250 years old and are written in Grantha, Telugu and Nandinagari. Every class of literature is covered, and many works appear here for the first time. The collection is especially rich in religion and philosophy. It has been cataloged by Indian pandits, and is offered for 60,000 marks.

....The American Bureau of Industrial Research with the aid of the Carnegie Institution of Washington has been engaged for many years in the preparation of a work of unique importance to the economic history of our country, which is to be published by the Arthur H. Clark Company, Cleveland, Ohio, in ten large 8vo. volumes at \$50 per set. The advance orders are taken at \$40. This *Documentary History of American Industrial Society* will be essential to all libraries where historical and economic research work is being carried on, for much of the material here collected has been drawn from rare files of newspapers and unpublished diaries and letters. Prof. Richard T. Ely, of the University of Michigan, contributes a preface and Prof. John B. Clark, of Columbia, an introduction. Vols. I-III, by Prof. U. B. Phillips, of Tulane University, deal with the industrial conditions in the South, with the slavery and plantation system, and the West and movement. Vols. III-IV, 1860-1882, give the seasonal industrial reports, strikes, and decisions of the labor regulatory commission. Vols. V to X represent a complete history of the labor movement from 1880

to 1880, in its political, sociological and economic aspects. With exception of the first two volumes the work has been done by Prof. John R. Commons, of the University of Wisconsin, with the collaboration of Prof. E. A. Gilmore, Dr. Helen L. Sumner and Dr. John B. Andrews.

Pebbles

"THAT man has broken more records than any one else I ever heard of."

"A runner?"

"No; he owns a graphophone."—*The Chaparral*.

ENGLISH I.

"To-whit! To who!" the young owl cried,
Till his father spake in the gloom,
"How many times must you be told
You ought to say, 'To whom?'"

—*Amherst Four-Leaf Clover*.

ITS REAL EFFECT.

Jacob A. Riis was talking about witty newspaper headlines.

"As witty a headline as I know of," said he, "was written by a youth of eighteen in a San Francisco newspaper office. There was a bill up to prohibit the sale of alcoholic drinks within four miles of the University of California, and this bill the youth headed:

"An Act to Promote Pedestrianism Among Our Students."—*Washington Star*.

IN the course of a speech not long ago Representative John Sharp Williams illustrated his point by a story of an old colored woman in Alabama, whose extreme age and helplessness were such that her neighbors felt called upon to supply all her needs.

The aged negress was very grateful for all such attentions, and never failed to express her gratitude therefor in original language.

It appearing one day that she could not sufficiently thank the son of an old friend who had brought her some choice fruit, the old woman said:

"You is powerful good to a pore ole woman like me, wid one foot in de grave an' de odder a-cryin' out, 'How long, oh Lawd, how long?'" —*Philadelphia Ledger*.

JOHNNY loved his papa, there was no doubt about that, and one morning, after he had listened to a long disquisition from the author of his being, addressed to his elders, on the general uselessness of the vermiform appendix, ending up with the broad statement that he hoped he'd see the day when every appendix in creation was cut out, the little boy resolved upon an agreeable surprise for his daddy. He worked in secret for several days, and then sprang it.

"See what I have done for you, daddy!" he said, leading the wondering father into the library, and showing him a neat pile of many pages which he had accumulated. "I've cut the appendix out of every book in this library."

It was then that words failed, and Johnny's father's vocabulary made a general assignment for the benefit of its creditors.—*Judge*.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.
One Year, \$2.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of *The Independent* are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

Edward Everett Hale

THE man whose death we regretfully record today was the best beloved clergyman in the United States, and a Unitarian. He was eighty-seven years old, and so a year and a half older than Colonel Higginson, who now remains, with Julia Ward Howe, the last survivor of the brilliant circle who made Boston once the literary center of the country. But Boston has changed since then—and so has Harvard.

Dr. Hale was also the last survivor of the great line of Unitarian preachers, which included Theodore Parker, Dr. Bellows and half a dozen others that might be mentioned, not to speak of those who withdrew into other Churches, like Bishop Huntington and Dr. Hepworth, and not to mention those that relapsed into literature, like Ralph Waldo Emerson and Colonel Higginson. But Dr. Hale was first of all a preacher, no matter how much time and labor he gave to literature, for all his writing was preaching, and of the most useful and delightful sort. He was a Unitarian, but not that kind of Unitarian that fights the Orthodox. He loved them too well. He was faithful to his convictions and his

denominational fellowship, but it was not the negation of his religion that he cared for, but its positive faith and purpose to uplift the world. Accordingly, the whole Christian Church adopted him, and he adopted them all. When Newman Hall visited this country, where in Boston should he be invited to preach but in Dr. Hale's Unitarian church, where he preached the same Gospel he preached in London, and to Hale's complete satisfaction? It was not the Unitarian clergyman, Dr. Hale, that the United States Senate chose as their chaplain, but the ecumenical Christian. He was the most honored and beloved of all the annual speakers at Chautauqua, dearest of all to the Methodist bishop who was so long its presiding genius.

What did he care for money or fame or position? He was all the time giving away his money to the good causes and the world's needs that appealed to him, and his Harvard classmates and his Boston friends who had bothered themselves with such miserable business as making money were happy to turn in every once in a while to supply his lack of selfish thrift. He never thought of himself, he was too busy going about doing good, the least self-conscious man in all literary fellowships, too busy to think how he looked, how he was dressed, even how finely and finically he could polish a paragraph. He was after the history he was telling, the story he was writing, and that was for the social or moral lesson behind it, the patriotism or the religion.

The names of the books he wrote would fill a column, but we must mention two or three. He came to fame with the best story of patriotism ever written, "The Man Without a Country." It was so real that multitudes have written to be informed what was the fate of the vessel in which the sad traitor was buried from the world. His little stories, "Ten Times One Is Ten" and "In His Name," have possibly been the origin of "endless chains," but they have been more than story or sermon, for they have developed into numerous clubs or Chautauqua circles of young people for mutual helpfulness among those who "look upward and not downward, forward and not backward, outward and not inward, and lend a hand."

Edward Everett Hale has been one of the most valued writers for THE INDEPENDENT these fifty years. Of late years he has been driven to autobiographical reminiscence by the insistence of literary friends, but his choice has always been to look forward rather than backward, and thus to make character rather than to write history. His face was a mirror of hope and optimism and love. Did we say he was a Unitarian? We did not mean it; he was eminently and idealistically a disciple of Christ.

✽

Has the Presbyterian Church a Creed?

It has been usually supposed, among those not informed, that the Presbyterian Church has a written creed, namely, the Westminster Confession of Faith, with the Longer and Shorter Catechisms. It is not strange that such should be the common notion, for they are officially published, with the Plan of Government and Discipline, in a volume entitled "The Constitution of the Presbyterian Church in the United States of America." To be sure, it was abundantly well known that the doctrinal statements of the Confession and Catechisms are not imposed on communicants, but it has been a common notion that all Church officers have been required to subscribe to them.

The basis of this common belief is in the fact that every minister, elder or deacon in the Presbyterian Church is required to answer affirmatively the following question:

"Do you solemnly receive and adopt the Confession of Faith of this Church as containing the system of doctrine taught in the Holy Scriptures."

The error consists in not sufficiently apprehending the looseness of the phrase, "Containing the system of doctrine." It is purposefully indefinite, nowhere defined. This undefined "system of doctrine," it is merely asserted, is somewhere contained in the Confession, but where we are not told.

The meeting of the General Assembly last month in Denver took pains to emphasize this indefiniteness and to declare that the "system of doctrine" is nowhere put in words not even in the Confession.

It had occasion to do this because of the action of the Supreme Court of Tennessee in giving the property of the Cumberland Church, which had joined the Presbyterian Church, to the minority which had refused to unite. In other States the courts had recognized the interpretations of the General Assemblies as final, but Tennessee's action seemed to require a restatement by the united General Assembly on the subject of subscription to creeds.

To one sentence only we find it important to call attention, as it puts the case so positively:

"No authority other than the General Assembly could in either Church before the union, or can now in the united Church, determine the exact contents of the 'system of doctrine.' Judgments on this subject are pronounced only as occasion for them arises. Therefore the contents of the 'system of doctrine' always have been in both Churches, and are now in the reunited Church, not fully stated and adjudicated."

The above is official, final. The Presbyterian Church has no written creed that any officer is obliged to subscribe to. Those best informed have known it for a long time. They know that the term "system of doctrine" was made of india rubber; that it was anywhere as much or little as any one was pleased to believe, in the Confession of Faith, but nowhere written and formulated so that one could put his finger on it. It is "not fully stated and adjudicated," which is a plain but mild way of stating the case.

This is a happy condition for a Church to be in, and it is particularly happy that the Presbyterian Church should thus officially state a fact which has been, since the adoption of what is known as the Shorter Creed, admitted by implication. A creed is a fine thing if it is frequently made, never adopted, and constantly open for revision. When the Presbyterian Church half a dozen years ago promulgated a softened creed, so as to satisfy the Cumberland Presbyterians, it gave notice that the old Confession had been sent to the scrap-heap; it now tells us that not even this new one is of binding authority. And the Assembly is right. The Church, thru its members, is ever under obligation to seek the truth for itself, and rest on no man's authority, and be tied to the authority of no Coun-

cil or Assembly. They may err and have erred, and the most any man or any Church can do is to search honestly and daily after the truth, trusting to the guidance of the Holy Spirit, which will lead unto all truth.

Mr. Taft and the Tariff

"THE tariff ought to be lowered," said Mr. Taft, in September last. The Republican platform called for "such duties as will equal the difference between the cost of production at home and abroad, with a reasonable profit to American industries." In his letter of acceptance, Mr. Taft said:

"The tariff in a number of schedules exceeds the difference between the cost of production of such articles abroad and at home, including a reasonable profit to the American producer. The excess over that difference serves no useful purpose, but offers a temptation to those who would monopolize the production and the sale of such articles in this country to profit by the excessive rates. On the other hand, there are some few schedules in which the tariff is not sufficiently high to give the measure of protection which they should receive upon Republican principles, and as to those the tariff should be raised."

During the campaign he repeatedly expressed the opinion that revision should be made, with respect to a majority of the duties, by reduction. He knew, of course, that the popular demand was neither for an increase of the present rates nor for a re-enactment of them. In September, at Cincinnati, he said:

"The Dingley tariff has served the country well, but its rates have become generally excessive. They have become excessive because conditions have changed since its passage in 1896. Some of the rates are probably too low, due also to the change of conditions. But, on the whole, the tariff ought to be lowered."

"It is my judgment," said he, in another public address, "that a revision of the tariff in accordance with the pledge of the platform will be, on the whole, a substantial revision downward." And in December last, having in mind this pledge of the platform and the expectation of the people, he spoke as follows:

"Unless we act in accordance with our promise, or if we only keep the word of promise to the ear and break it to the hope, we shall be made accountable to the American people and suffer such consequences as failure to keep faith has always been visited with. It would be better to have no revision at all, un-

less we are going honestly and fairly to revise the tariff on the basis promised by our party."

Everybody knows now what kind of a bill he will be asked to sign. The duties of the House bill were fixed some time ago; those of the Senate bill are now practically determined. Unless instructed to do so by special vote, the conference committee will not touch rates as to which Senate and House agree. It is absolutely certain that this committee will be controlled by representatives of the Payne majority in the House and representatives of the Aldrich majority in the Senate. In conference they will not be inclined to reverse the positions which they have already taken. They will not vote there to satisfy the demands of those Republican insurgents whom Mr. Aldrich has tried to read out of the party, and who, he says, are seeking to destroy protection, altho they have merely, as a rule, fought against additions to those Dingley rates which Mr. Taft has called excessive.

Both the Senate bill and the House bill break the promise of the platform and are at variance with Mr. Taft's conception of a proper and just revision. The conference bill will be of the same character. We have been speaking only of the ordinary duties, and it is with respect to these that the comparative statements have usually been made. But it is intended that there shall be added a new method of valuation which would increase many of the rates by perhaps 50 per cent. This has not yet been discussed in the Senate. There is also the Aldrich maximum, which involves a flat addition of 25 per cent., for a time at least, with respect to a considerable volume of imports. If such a bill as is now foreshadowed shall become a law, the Dingley average of about 44 per cent. may, as Senator Overman has undertaken to prove, be increased to 71 per cent.

We do not believe that Mr. Taft will sign this kind of a bill. The Republican insurgents, who are the real protectionists on their side of the Senate, complain that from him they have been able to get no word of encouragement, altho their position is in accord with his public utterances during the campaign. They point out that, on the other hand, he is frequently in consultation with Mr. Ald-

rich. But this does not prove that Mr. Aldrich's course and bill have his approval. We do not believe that he will sign such a bill as the Aldrich majority and the Cannon-Payne majority are planning to lay before him. He will not be able to convince himself that he ought thus to act at variance with his repeatedly declared opinions, to break what are regarded as his promises, and to disappoint a great majority of the American people. They expect that he will continue to insist upon a "substantial revision downward," a revision which will tend to reduce the cost of living, which has increased by more than 30 per cent. since the present tariff was enacted.

The Indiscriminate Extension of the Ballot

IN a very notable and well reasoned article in this issue Mr. Walling develops the argument which we presented last week under the title, "Liberty, Equality and Fraternity, Limited." He directs attention to the prevalence of the view that our Revolutionary fathers went too far when they asserted the equal right of the whole people to rule and the substitution for it of the doctrine of aristocracy of culture, wealth or birth. We have been surprised lately to see an example of this latter view from a source where we had least expected it.

In declining to sign a call for a conference in this city the other day Colonel Higginson said:

"In 1868 and ever since I have regarded the indiscriminate extension of the suffrage to an entire class as a class, whether negroes or others, to be politically inexpedient; that is, not conducive to the general interest, which in this particular is more important than the interest of the individual.

"The extension of this right to negroes as a class was and is in my opinion particularly unwise, and a cause of great friction between the races and an injury to the negro himself. He would better turn himself to his industrial and educational development than to strive for the establishment of a civil and political status which, whether or not his under existing law, can never be effectually attained; or if ever, only thru a conflict of terrible consequence.

"No white community will ever consent to the political supremacy of either the black man or the colored man or the yellow man. I make this declaration philosophically and as the result of observation and reflection and absolutely without feeling or prejudice, for I have none."

Considering that Colonel Higginson commanded the first negro regiment in the Civil War we may assume that he has no racial prejudice against the black man. He would treat him just as well as he would the white.

But how would he treat the white man? He says that since 1868—that is, two years before the Fifteenth Amendment—he has regarded the indiscriminate extension of the suffrage as politically inexpedient, whatever the class—that is, whatever the race or sex. Some things in this matter need to be considered.

Particularly, he says, "the extension of this right to negroes as a class" was "particularly unwise." But the real fact is that the right of suffrage was never given to negroes as a class. The Fifteenth Amendment says nothing of the sort. It simply forbids excluding them as a class. It reads:

"The right of citizens of the United States to vote shall not be denied or abridged by the United States, or by any State, on account of race, color, or previous condition of servitude."

This Amendment does not give negroes as a class the right to vote, for under it a multitude of negroes may be excluded from the ballot for illiteracy, as is the case in Massachusetts and Mississippi. It simply says that they shall not be discriminated against on account of race or color. We cannot believe that Colonel Higginson will object to that. They are human and should have the same rights as other men, or democracy is a sham.

But there is the serious question here involved, Is democracy a sham? Can we trust the people, or should we be governed by an aristocracy of wealth or education or religion or birth or brains? A multitude of people believe that such an aristocracy should rule. The lords and lordlings in Great Britain believe they have this divine right. In Turkey and Russia those of the Moslem or Orthodox faith hold the right of rule sacred to themselves only; and the A. P. A. has maintained a similar right in favor of Protestants in this country. In Rhode Island the men of property have held that they have the right to veto the will of poor people. In Massachusetts and Mississippi the educated want all the authority for themselves, because they cannot trust the ignorant man. We imagine that it is the sentiment of Boston and Cam-

bridge, this aristocratic claim, which Colonel Higginson represents when he says that he is opposed to the unrestricted extension of the ballot.

We are positive and consistent believers in democracy. We believe in it because we not only believe in the principles of the Declaration of Independence, but because we believe democracy is the safest, sanest basis of government. We believe it to be safe and sane because we believe that men and women as a whole want right and justice done, and are capable, as a whole, to judge correctly what is right and just, if it is presented to them. And we further believe that it is well that the right and just should be presented to them, that they should be educated, and that so much power should be given them that it will be for the interest and safety of the State to see to it that they are educated. Massachusetts has the best school system in the country. It has had the experience of educating a vast number of uneducated people. It has found it safe and saving. It could afford to trust its illiterates to vote, under the tutelage by political methods of its educated voters. In any State the privilege given to the illiterate to vote is a compulsion on the wealthier and better educated to lift the standard of the lower. When the suffrage was extended by Disraeli to millions of voters in Great Britain the word went forth, "Now we must educate our rulers." Before that they were indifferent; they did not dare to be indifferent longer. What cares the ruling class in Russia for the education of the rude serf? We favor universal unrestricted suffrage because we want the very mudsills of society lifted. We want no favored aristocracy of wealth or culture. If there be wealth and culture—and there always will—let it be forced to use its wealth and culture to raise the lowest, forced even in self-defense.

So we cannot subscribe to Colonel Higginson's dictum. We do not believe in any discriminate restriction of the suffrage; we do believe in the indiscriminate, undiscriminating extension of the suffrage, without regard to race, color, sex or education. We believe that absolute democracy is safe; not only safe, but far safer than any doctrine of oligarchy or aristocracy.

The Carnegie Foundation and the George Washington University

WHEN a man sets a lump sum of \$15,000,000 rolling around the country there is no knowing what it will do. It was supposed that the endowment provided by Mr. Carnegie for the pensioning of superannuated college professors would simply serve to ease the declining years of a useful and underpaid class of public servants. Who anticipated that in less than five years it would effect profound changes in the constitution and management of our colleges, severing venerable denominational ties, tightening up requirements of admission, differentiating the college from the university, systemizing finances, raising salaries and in many more subtle ways modifying the life and work of thousands of educators?

One effect that seems not to have been anticipated is the tendency to cut off men from active educational work at an age when their services are really of more value than in their earlier years. The provision that a professor may retire on a pension after twenty-five years of teaching is liable to be interpreted in a mandatory way in some cases. When a president, who is hard up for money, considers that the retirement of one of his head professors will enable him to hire two younger men in his place and also save one or two thousand dollars, he is strongly tempted to hint to the incumbent of the chair that his room is better than his company, or even to shove him off unceremoniously on to the Foundation.

That the George Washington University has succumbed to this temptation in the recent dismissal of Prof. J. Macbride Sterrett and Prof. J. H. Gore seems to be the opinion of the executive committee of the Carnegie Foundation. As this is the first case where the Foundation has withdrawn its support from a university on account of its failure to maintain the required standards it may be of interest to quote in full President Pritchett's letter announcing this action:

JUNE 4, 1900

President Charles W. Needham, The George Washington University, Washington, D. C.

DEAR SIR—I am directed by the executive committee of the Carnegie Foundation for the

Advancement of Teaching to send to you as president of the George Washington University the following communication:

The George Washington University reported to the Foundation a productive endowment of \$219,832.96 as of date August 21, 1907. In the financial statement submitted some time since it reported as of date October 3, 1908, a productive endowment of \$123,500.

The rules of the Carnegie Foundation require that an institution, to be entitled to the privileges of the retiring allowance system, must have a productive endowment of not less than \$200,000. This proviso was made because experience has proved that no college can maintain fair educational standards without adequate endowment.

The examination which I have just caused to be made of the George Washington University shows that its announced standards of admission to the various schools are not enforced.

In the college division of the university regular students are admitted with reasonable regard to the stated admission requirements, but of the total enrollment more than one third are special students. The value of the A. B. degree, however, is seriously lowered by the lax administration of the College of Political Sciences and the Division of Education, to which admission is granted with little regard to the published entrance requirements. The Law School announces a four year high school education as a prerequisite for admission, but does not enforce it. Similarly in the Medical School the announced requirements for admission have been repeatedly evaded. If the entrance requirements to this school were actually enforced, the enrollment would be so greatly reduced that the department could not continue; a result, I may add, entirely in the interest of medical education, since the District of Columbia and the region about it are over-supplied not only with physicians, but with weak medical schools.

The executive feels compelled also to protest against the extraordinary action of the institution in forcibly retiring two professors, both of whom are in the prime of their active teaching, on the ground that the institution needs to save money by the employment of cheaper men. Such action is not only an abuse of the privileges of the retiring allowance system, but it is entirely contrary to the spirit in which this Foundation was conceived and is a blow at academic dignity and academic freedom.

The committee further calls your attention to the following extract from the rules for the admission of institutions, "The Trustees of the Carnegie Foundation for the Advancement of Teaching reserve the right to discontinue the privilege of participation in the system of retiring allowances of the Foundation whenever, in the judgment of the trustees, an institution ceases to conform to the regulations maintained by the trustees. Such withdrawal shall not, however, result in the discontinuance of retiring allowances already granted."

The executive committee, by virtue of the authority conferred upon it under the bylaws, in view of the conditions existing in the

George Washington University referred to above, conditions which are entirely out of harmony with the educational ideals for which the Foundation stands, informs you with great regret that the relation of the George Washington University as an accepted institution is terminated with this date.

I am, Very truly yours,

(Signed) HENRY S. PRITCHETT,
President.

The Foundation has granted a retiring allowance to both the dismissed professors, altho it had to stretch a point in the case of Professor Sterrett by counting the ten years he taught in Seabury Divinity School, Faribault, as part of his twenty-seven years of service. Professor Sterrett is now sixty-two years old and Professor Gore only fifty-three. Both men have a high reputation as teachers and authors, in the fields, respectively, of philosophy and geodesy.

It will be noted that the action of the Carnegie Foundation is based primarily upon the reported impairment of the productive endowment of the university below the minimum of \$200,000. President Needham, on the other hand, states in an interview that "the total assets" of the university are greater than they were in 1900 and also that "the standards of admission have been advanced and are honestly upheld and administered."

That the university is running on a narrow margin is shown by the president's statement that the students' fees pay 63 per cent. of the cost of their education. This is not necessarily to the discredit of the institution. Its financial difficulties are caused by its efforts to expand into a metropolitan university of the standing of Columbia and Chicago. Its plans are ambitious, but not impracticable, and we hope they will be carried out. There should be a great university at Washington; if not a national university as advocated by President Hoyt and others crowning our State university system, then certainly an independent institution of the high character that the George Washington University aspires to be.

The national capital affords a unique opportunity for advanced graduate work, particularly in connection with the scientific departments of the Government, and for the establishment of a school of political science in preparation for consular,

diplomatic and administrative positions. Dr. Richard D. Harlan, of Washington, is leader of a movement to raise an endowment for the university which shall enable it to take full advantage of its strategic position, and those who wish to help the institution should write him for its aims.

The action of the Carnegie Foundation will have a good effect on other institutions in making them more careful to guard against laxity of standards and mistakes of administration. It may also have a good effect on George Washington University in rallying its friends to its support and raising its endowment far above the minimum stipulated by the Foundation.

A National Disgrace

A statistical investigation which promised to yield important results was brought to sudden termination a few weeks ago, in one of our largest universities, because it was discovered that nowhere in the United States of America does there exist such a thing as a table or other record of the areas of the towns or townships composing our forty-seven commonwealths. This fact seemed so scandalous as to be almost incredible. To make sure that there was no mistake about it, inquiries were sent to the Geological Survey, to a prominent official of the Census Office, and to the Secretary of State of every commonwealth in the union. Answers were received to all but three or four of the letters of inquiry. The result was as had been anticipated. Not only is this information not to be had from any authoritative source for the United States as a whole, but it is not to be had from any State records of the States themselves.

We call this state of things scandalous, and it is. Here is an elementary fact of our political geography, essential for a hundred statistical inquiries, if these are to be made more detailed and thoroughgoing than a crude comparison of State with State; yet neither State governments nor the National Government have had the sense to provide it. What makes the neglect more disgraceful, however, is the circumstance that this particular fact is indicative of the whole attitude of both

State legislatures and the National Congress toward attempts to obtain scientific knowledge of the American population and its doings. Congress has never yet acted upon a census bill without sacrificing scientific considerations to political jobbery and the personal rascalities of individual Congressmen. In fact, if any one desired to prove the thesis that members of the National Congress in both the House of Representatives and the Senate since the Civil War have been generally unfit to represent an intelligent people, he would need only to analyze the votes on the decennial census bills without bothering to dig into the rottenness of currency and tariff legislation.

Since 1881 Congress has increased the average yearly expenditures of the Federal Government from \$258,349,469 to \$555,522,640. What proportion of this doubling up of the budget has been necessary we do not undertake to say. Nobody but a fool supposes that a very large part of it has not been the price of stupidity, jobbery and graft. Yet, with millions of dollars to waste, Congress can never find money enough to pay for obtaining necessary information about the nation and its interests, and putting it at the disposal of persons who know how to analyze and to use it.

We will call attention to one more instance. In a recent number of *Science* Professor Franz Boas has properly deprecated the loose discussion of the alleged dangers of race intermixture thru our great and miscellaneous immigration. He points out that it is quite impossible for any one to make true scientific predictions in these matters because we have no adequate statistics of intermarriages of nationality with nationality. Again, the passion and bitterness that are wasted over the question of white and negro intermixture lead to nothing, because, with an unprecedented opportunity for making invaluable scientific studies of the effects, in heredity and otherwise, of such intermixture, we have not as yet taken the first steps toward obtaining the necessary statistical data.

It is quite true that the decennial population census should not be loaded down with so many inquiries that no part of the work can be well done. But that is no longer necessary. We now have a

permanent Census Bureau, organized to carry on a continuous collection, tabulation and publication of statistical data. With this equipment for the work, there is no excuse for neglecting to obtain, among other desirable stores of information, the following particulars which are of elemental necessity for any real discussion of our social problems, namely: (1) A complete table of local areas; (2) a complete table by units not larger than townships of the distribution of our foreign born nationalities; (3) a complete record of the intermarriages of nationalities; (4) a thoroughgoing statistical description of the colored population.

That we do not already possess this information is a national disgrace.

Another Step Forward

IN a recent article in *THE INDEPENDENT* one of our writers suggested the federalizing of our agricultural colleges at Washington. This led to a correspondence, suggesting that the thought be worked out formally, and that the writer of the article propose some method whereby, at Washington, there might be a sort of clearing house of the several State colleges and experiment stations. There seems to be no good reason why we might not have an American University of Agriculture at our national capital, which might serve the purpose suggested, and at the same time go farther, in doing such advanced work as might be classed as strictly university work; a school for the graduate work of those who have already passed thru the State colleges or otherwise secured graduate privileges. We are rapidly accumulating the problems for such a university. Our Department of Agriculture is handling some of these questions as well as it can with its present organization.

But leaving this question for the present, why should there not be a conference or university convocation of all our State industrial colleges at Washington once a year, possibly during the month of September; a convocation of the presidents or deans of the colleges and such professors as may be elected by the faculties?

More specifically, what would be the

object of the conference? This would surely unfold and shape itself with freedom, but we might anticipate the discussion of the most important annual discoveries and experiments of the State colleges. These would be sifted, compared and possibly corrected. Certainly a review of localized work by a body of pronounced experts, trained to the broadest generalizations as well as the keenest analysis, would be of national value. A second object would be to take charge of interstate problems of an agricultural and industrial sort. Production is not limited by State lines, and the marketing of agricultural products reaches from California to Maine. We cannot, much as we would, confine the codlin moths, the gypsy moths, the root galls, the blights and the beetles. In the third place, the conference would prevent an iterant waste of force in experimentation. This is an important matter to be attended to, in order that the bulletins sent out to the farmers shall not traverse the ground of experiment repeatedly, and frequently with contradictory conclusions.

A fourth purpose of the convocation might be to publish the more important discoveries, of course with due recognition of State investigators, but with added authority. A large amount of the best work that is now done is never heard from outside of narrow areas. Nor is there any reason why a national body of this sort should not serve as an arm of the International Institute of Agriculture, which is to meet annually in Rome. In this way an invulnerable world's peace organization would come about; a force, in every fiber of it, making for human good will and co-operation. The final world's organization will have to be on an industrial basis.

Congress might advisedly be asked to appropriate an adequate sum to pay the expenses of the convocation and to carry out any experiments proposed for the national welfare. The whole country is vitally interested in the increase of our productive power. The food problem is going to press keenly, and very soon we have got to make two blades of wheat grow where one grew before. Our corn must yield one hundred bushels to the acre and we must stop the waste of

one-fifth of our crops by insects, blights and our own heedlessness or ignorance. Our population will number two hundred and fifty hungry millions by the end of the present century. There are no more wild lands to pour the tide of immigration into or to be filled up by our natural increase. The tide is already backing up to reoccupy the deserted farms of New England. What we need is national organization on an industrial foundation.

Gatun and the Soo

The favorite argument of the American engineers who differed from their foreign colleagues in preferring a lock canal at Panama to a sea level has been the success of the Sault St. Marie Canal, which has been carrying in safety a larger traffic than the Suez. The favorite disaster prophesied by the opponents of the lock canal has been that some day a big liner, thru mistaken orders, would bump against the upper gate at the Gatun dam, and breaking thru, fall all the way down-stairs into the Atlantic, 85 feet below. This would drain the lake and it would take the Chagres River a year or two to fill it up again. An accident very much like this happened at the Soo last week, when the engineer of the "Perry G. Walker" went ahead instead of back, as the captain signaled, and rammed the lower gates while the upper gates were open. The "Crescent City," which was entering the lock from above, was sunk, and two other vessels damaged. The flood of water is not yet checked, and it may be months before the locks can be reconstructed, and this at the beginning of the busy season. Of course, the accident will revive the agitation for a change in the plans of the Panama Canal, but it is not likely to effect it, for the possibility of such a mishap has been sufficiently considered and so far as possible provided against. Vessels are not to be allowed to use their own steam in passing thru the Gatun locks, but will be towed thru by electric power under the control of the lock superintendents. There is also to be an extra set of emergency gates at the top, which will shut off the water if the locks should go, and the flight of locks being in duplicate, traffic will not be interrupted

What would the American people think of it if a young man who confesses forgery were told by the judge that sentence would be suspended if he entered Harvard as a student, or if he would join a plumbers' or carpenters' union? Should we not be told that these are no reformatories to which criminals can be condemned? And yet that is just what a judge in this city did in the case of a young fellow whose father had got tired of paying his forged checks. The late Rear Admiral Thomas, while in command of the Atlantic fleet a year ago, made a protest against the practice of enlisting incorrigible boys in the Navy, and gave notice that when such cases were discovered they would be dismissed from the service. The other day the United States Commissioner at Honolulu complained to a district judge against the practice of shipping criminals in the local jails as sailors. Seamen are a self-respecting class, and ought not to be so humiliated. We observe a serious protest in the *Coast Seamen's Journal* which deserves the attention of the courts.

There was a time, within the easy memory of old men, when the ministry was almost the only learned profession, and college presidents were all clergymen. Now the ministers are almost crowded out of the presidencies, not because the profession is less learned, but because the learned professions have so multiplied. Dartmouth College has just chosen its first president in all its history who is a layman, Prof. E. F. Nichols, of the department of Experimental Physics at Columbia University, who was formerly in the Dartmouth faculty, and is a man of broad interests. Dartmouth has had a magnificent succession of clerical presidents, such as Nathan Lord, Asa D. Smith and Samuel C. Bartlett, not to go further back, and ending with William J. Tucker, under whom the college has made wonderful advance. We will now see what a layman and a physicist can do.

An illustration of the disorganization of parties is the combination of Democrats and Republicans to organize the Illinois Legislature by defeating the regular Republican candidate as leader, and

then defeating for Senator a man who had carried the Republican primaries by a majority of 50,000, by the aid of a fusion of members of the two parties, and electing a Republican as Senator who was acceptable to the less estimable elements in the two parties. Are they Republicans? Are they Democrats? What separates the two? Even as President Taft asks, What is the difference if Republicans want a specified high tariff for "protection" and Democrats vote for the identical tariff for "revenue"?

The sale of the Duke of Norfolk's Holbein, which came so near coming out of the country has raised the proposition that Great Britain should have a law retaining art treasures, such as Italy and France have. In those countries a man cannot allow a valued work of art to leave the country without the nation having first the right to buy it at its own price. That will do for those countries, but Great Britain yet holds to free trade, and under that principle there should be no restraint to trade, and pictures should freely go to the country that most values them and will pay the most for them.

It is not agreeable to see the Irish members of Parliament voting with the Opposition against the finance bill on its second reading. To be sure, it had a large majority, but the action of the Irish members puts them against the most liberal budget ever offered, and aligns them with the Lords of the Upper House, who are the persistent enemies of all their ambitions. And the chief argument yet given by them against the bill is that it puts a tax on the poor man's whisky! If it could only legislate whisky utterly out of Ireland it would be the greatest blessing to that island.

One of the elder missionaries in Hawaii, in a paper before the Social Science Association says:

"In no part of the world do we find a population of more mixed races and nowhere do we find the individual of more more fully and cordially reserved. The Chinaman is not liable to have his queue pulled nor the Japanese lady her peculiar dress ridiculed. The respect of man for his manhood is cordially conceded rather than for his education, his

wealth, the color of his skin, or of his hair, or for the race in which he chanced to be born."

This shows superior civilization to what we often see in this country. But our civilization was not created by missionaries.

The Germans derive some fun out of the behavior of their Kaiser. It must have been in Leipzig, or somewhere thereabout, where in pronunciation *g* and *k* get badly confused, that a teacher gave a lesson in dictation to his scholars. "*Der Geiser* [geyser]—he has long spells of quiet, but the longer they last the more violently he boils and gushes when the outbreak comes, as come it must." Fritz got it all right but one word mis-spelt. He had *Kaiser* for *Geiser*, and he had to stay in an hour in expiation.

So it is announced in his *Commoner* that Mr. Bryan will be a candidate for the office of United States Senator from Nebraska. That is legitimate, and it is frank to announce it a year beforehand. The nomination comes under the direct primary law, and it will be interesting to see whether the people are yet tired of his unsuccessful candidacy.

Edward Everett Hale was in the habit of illustrating the diverse senses in which such words as *church* are used, much to logical mystification, by reminding his hearers that one man says his letter goes as fast as the post can carry it, while another sticks still as a post.

The fact is to be noticed that M. Briand, the French Minister who has introduced the bill forbidding employees of the Government to strike, is a Socialist. This shows his belief that no striking would be allowed in a Socialist state.

Another treaty of the right sort has been made between Venezuela and Colombia, which settles all disputes, even those of boundary and "honor." South America thus sets us another example.

If classical music should ever become popular which would it be?

Is the shed in which a dirigible is kept to be called a "dirage"?

Choosing a Profession

THE present is the commencement season. Thousands of young men are now just at the borderland between the school, the college and the ever mysterious world of business. Some of the more fortunate graduates have their futures all marked out for them. They will step into places that parents or friends have made for them, and their lives will flow on and on as it were to the sound of sweet music. With the majority *what to do* will presently become a problem. It sometimes seems as if there was nothing for some men to do. There is much that is exceedingly discouraging at the very best in exchanging the intellectual cloister for the market place of commerce. Horace Greeley is credited with a blunt and contemptuous reference to "college graduates and other horned cattle." Not any too much time is given to some to make a choice. The tremendous need is for something to do. All men cannot be bankers. There must be some work done outside the church, the law and medicine. While the newly diplomaed graduate pauses to survey the field it may be that the idea of engaging in the life insurance business has not occurred to him. Too often is life underwriting looked upon as the last refuge of him who has failed in all else. If, however, a man deliberately chooses this line of work and enters upon doing it with all his might and brings into his work all the enthusiasm, all the skill, all the talent that he had given him when life with all its mysteries come to him he will presently find the writing of life insurance to be a great work. It may be said regarding this profession that of all the avenues open to the young graduate there is none that offers a better or a larger opportunity to test his mettle than this same business of life underwriting. One very attractive feature about it lies in the fact that no outlay of cash capital is required. The "grad" does not have to buy an expensive "good will." All he has to do is to use faithfully, skillfully and conscien-

tiously his God-given powers, and if he has it in him success is certain. The compiled statistics of Yale University, class of 1907, cited by The Fidelity Mutual Life Insurance Company, show that the man who made the most money during his first year out of college made \$3,700 in life insurance soliciting. Possibly these lines may meet the eye of a man standing uncertainly at the crossroads and who may not have considered the profession here suggested. Possibly also in such a case these lines may help to solve a problem for him. Some life insurance presidents receive as much salary as does the President of these United States.

WHEN a man asks a woman to marry him it would be a most excellent preliminary if she were to say to him, "Are you insured?" and to base her answer to his proposal upon his reply to her counter question. Most men think they would do anything for the girl of whom they think enough to want as a wife. Sometimes a man under such circumstances offers to die for the girl to show good faith. But after the sounds of the wedding march have died away, the rumble of the carriage wheels driving home from the marriage ceremony have ceased, and the honeymoon is over, too many men neglect the matter of insurance. They take long chances and they make the girl take still longer chances with added handicaps. They forget that if the girl who has become the wife found it difficult to make a living before marriage, without dependents, her difficulties will be tremendously increased as a widow with one or more children. Most husbands are very selfish and very thoughtless if they neglect to insure. The girl should remember also that it will be much easier for her to dictate insurance before rather than after marriage. There is more to commend the excellence of insurance in a matrimonial alliance than is the case with too many other marriage settlements.

Industries and Crops

EVIDENCE of improvement continues to be seen most clearly in the condition of the steel industry and in building operations. May's pig iron output was 1,880,098 tons. This is the best record made since October, 1907, and it exceeds that of May, 1908, by 70 per cent. At the end of the month the weekly capacity of furnaces in blast had risen to a rate of 23,000,000 tons a year. Large quantities of rails have been ordered. Wages have been increased for 19,000 men by the Pennsylvania and Cambria companies. Work has been resumed in the National Tube Company's plant at Wheeling, where 5,000 men have been idle for more than a year. In the building trade, reports to *Bradstreet's* from 104 cities show that May's record exceeds that of any past month since such statistics have been gathered, the advance being 11.2 per cent. over April, and 75.7 per cent. over May a year ago. For the five months since January 1 it is 73 per cent. The crop reports of last week were not wholly favorable. Winter wheat's condition has declined since May 1 nearly 3 points, and a crop of about 400,000,000 bushels is indicated, against last year's 438,000,000. The spring wheat area shows an increase of 1,183,000 acres, or about 7 per cent., the condition is good, and a crop of about 253,000,000 bushels is expected. This would make a total of 653,000,000. Last year's was 664,600,000. Oats are low in condition, but a crop largely exceeding last year's is promised. A considerable increase of the yield of barley is indicated, owing partly to an increase of acreage. The general average condition of crop growth is 4 per cent. below that of one year ago, but 8 per cent. higher than that of two years ago.

Chinese Loans

THE most significant and important feature of the movement for participation in Chinese loans by a syndicate composed of J. P. Morgan & Co., Kuhn,

Loeb & Co., the National City Bank and the First National Bank, is that it has the aid and moral support of our Government. This has been shown in various ways, notably when the announcement of purpose or of rightful claim was made by our Ambassadors at the three European capitals. It is understood that the agreement or protocol signed on the 6th for the loan of \$27,500,000 by British, German and French bankers carried an option on future loans, with control of supplies of railway material in the lenders' interest. Our Government may reasonably object to such provisions, in the interest of our export trade, but its favor is warranted by considerations of greater weight. Our political influence can be most effectively exerted in China, and for China's welfare, when it is supported by the honest influence of American capital present in that country. The movement promises to be one of far-reaching importance. The syndicate is one of almost unlimited resources. There should be a fair market here for Chinese bonds. It may be noted that those of several recent issues placed abroad are now from 2 to 8 points above the prices at which they were originally sold.

....The oldest bank in New York, and, with the exception of the Bank of North America, in Philadelphia, the oldest in the United States, is the Bank of New York, which opened for business on June 9, 125 years ago, at 67 St. George's Square, now called Franklin Square. It was organized by Alexander Hamilton, the first Secretary of the Treasury. Gen. Alexander McDougall was president, and among the directors were Isaac Roosevelt, John Vanderbilt, Samuel Franklin and Joshua Waddington. After three years the bank was moved to 11 Hanover Square, and ten years later (in June, 1797) to its present location, at the corner of Wall and William streets. This was one of the few banks that were allowed to come into the national banking system without change of name.

No. 3160

Survey of the World

President Taft's Tax Message

It was known at the beginning of last week that the President had decided to send to Congress a message recommending that a tax be imposed upon the net income of corporations, and that a resolution be adopted for an amendment to the Constitution granting to the Federal Government the right to collect an income tax. On the 16th this message was received. Having referred to the adoption by the House of his suggestion concerning an inheritance tax, to indications that the Senate will not concur, and to the pending proposition in the Senate for a general income tax, "in form and substance of almost exactly the same character as that" which was held by the Supreme Court to be forbidden by the Constitution, he says:

"The decision of the Supreme Court in the income tax cases deprived the National Government of a power which, by reason of previous decisions of the court, it was generally supposed that Government had. It is undoubtedly a power the National Government ought to have. It might be indispensable to the Nation's life in great crises. Altho I have not considered a Constitutional amendment as necessary to the exercise of certain phases of this power, a mature consideration has satisfied me that an amendment is the only proper course for its establishment to its full extent. I therefore recommend to the Congress that both Houses, by a two-thirds vote, shall propose an amendment to the Constitution conferring the power to levy an income tax upon the National Government without apportionment among the States in proportion to population. This course is much to be preferred to the one proposed of reenacting a law once judicially declared to be unconstitutional. For the Congress to assume that the court will reverse itself and to enact legislation on such an assumption will not strengthen popular confidence in the stability of judicial construction of the Constitution. It is much wiser policy to accept the decision and remedy the defect by amendment in due and regular course."

Enactment of the proposed income tax bill, he continues, would not bring in

money to meet the present deficit, for if the court should stand by its former decision no tax would be collected, and if that decision should be reversed there would be no collection until after protracted delay. As to difficulty about securing the approval of three-fourths of the States, he says:

"Of course no one can speak with certainty upon this point, but I have become convinced that a great majority of the people of this country are in favor of vesting the National Government with power to levy an income tax, and that they will secure the adoption of the amendment in the States if proposed to them."

Having pointed out that the court's decision in the income tax cases left the National Government power to levy "an excise tax which accomplishes the same purpose as a corporation income tax and is free from certain objections urged against the proposed income tax bill," he continues:

"I therefore recommend an amendment to the Tariff bill imposing upon all corporations and joint stock companies for profit, except national banks (otherwise taxed), savings banks and building and loan associations, an excise tax measured by 2 per cent. on the net income of such corporations. This is an excise tax upon the privilege of doing business as an artificial entity and of freedom from a general partnership liability enjoyed by those who own the stock. I am informed that a 2 per cent. tax of this character would bring into the Treasury of the United States not less than \$25,000,000.

"The decision of the Supreme Court in the case of the Spreckels Sugar Refining Company against McClain seems clearly to establish the principle that such a tax as this is an excise tax upon privilege and not a direct tax on property, and is within the Federal power without apportionment according to population. The tax on net income is preferable to one proportionate to a percentage of the gross receipts because it is a tax upon success and not failure. It imposes a burden on the source of the income at a time when the corporation is well able to pay and when collection is easy.

"Another merit of this tax is the Federal supervision, which must be exercised in order to make the law effective, over the annual ac-

counts and business transactions of all corporations. While the faculty of assuming a corporate form has been of the utmost utility in the business world, it is also true that substantially all of the abuses and all of the evils which have aroused the public to the necessity of reform were made possible by the use of this very faculty. If now by a perfectly legitimate and effective system of taxation we are incidentally able to possess the Government and the stockholders and the public of the knowledge of the real business transactions and the gains and profits of every corporation in the country, we have made a long step toward that supervisory control of corporations which may prevent a further abuse of power."

In conclusion, he again recommends the adoption of the resolution for an income-tax amendment to the Constitution, and the enactment of the proposed tax on net income of corporations, "either as a substitute for, or in addition to, the inheritance tax."—It was generally admitted that the message, and the advocacy of Mr. Taft's policy by Mr. Aldrich's committee, would divide the insurgent forces. Some said Mr. Aldrich had procured the President's help as soon as he saw that the income tax bill had a majority in the Senate; but it appears that the net earnings tax was suggested by the President to Mr. Payne before the House bill was passed. A statement issued by five Republican insurgents said that it was their duty to continue to work for an income tax bill, but that they would gladly support a resolution for an amendment to the Constitution. The insurgents were reported to be in an unpleasant frame of mind. Some of them were saying that while the President had not used his influence in support of their efforts to prevent revision upward, he had interfered to their discomfiture when Mr. Aldrich's supremacy was in danger. The net earnings tax was opposed by some upon the ground that it would bear heavily upon persons owning small quantities of stock, but would not touch great fortunes invested in bonds, also because corporations could shift the burden to consumers. Attorney-General Wickersham was engaged last week in preparing the corporation income amendment. It was desired that the net earnings or income subject to tax should include the sum required for interest on bonds, but such inclusion is said to be prevented by court decisions, and at the end of the week it was understood that the interest fund

must be excluded. It was pointed out that the President had erred in speaking (in his message) of "putting on the statute book a law already there and never repealed" (meaning the income tax law of 1894), because that law expired by limitation in 1900.

The Tariff Debate

In the tariff debate, the committee's provisions concerning the free admission of sugar and tobacco from the Philippines, under limits of quantity, were adopted, the committee having reduced the limit for cigars from 150,000,000 to 70,000,000. It was asserted by two or three of the insurgents that the provisions relating to sugar were in the interest of the trust. Mr. Root opposed the modification of the limit for cigars, speaking earnestly of our duties and responsibilities in the Philippines. Mr. Borah argued that independence should be granted to the Filipinos. Mr. Stone's amendment, granting independence twenty-five years hence, was lost, 18 to 44. The final vote on the committee's Philippine sugar and tobacco schedule was 42 to 28. When the rates on print paper and wood pulp were taken up, Mr. Brown moved that both products be put on the free list. This was lost, 29 to 52. The committee had reported \$4 per ton for print paper, against \$2 in the House bill and \$6 in the present law. It was supported by a vote of 44 to 32. In the discussion the report of the Mann committee to the House was cited by those who urged that the duties be removed. On the 18th there was another factional dispute on the Democratic side, the leading speakers being Mr. Bailey and Mr. Hughes. These and other Democratic Senators explained and defended their votes in support of certain protective duties. The Democratic platform and Mr. Bryan's defeats were again considered. On the following day it was agreed that the Bailey and Cummins income tax bills, together with the two tax measures recommended by the President, should be taken up at the same time, but that work upon the tariff rates should first be finished. The committee has decided to restore the duty of 15 per cent. on hides.

Patrick Calhoun Not Convicted

At the end of the long trial of Patrick Calhoun, in San Francisco, on the 20th, the jury reported that an agreement could not be reached. Ten jurors had voted on the fifth and last ballot for acquittal and two for conviction. On the first ballot there had been four votes for conviction. Otto Hildebracht is the juror who prevented acquittal, for Theodore Binner, his associate in the minority, had offered to join him if he would go over to the majority. Prosecutor Heney said he was ready to begin a new trial on the same indictment. Mr. Calhoun said to reporters, after the jury had been discharged:

"The judge was hostile, the Assistant District Attorney bribed, and the administration of the criminal law of this State disgraced. I propose at the proper time, and in a proper manner, to submit formal charges against Assistant District Attorney Francis J. Heney for receiving bribes as a public officer, and against Rudolph Spreckels and James D. Phelan, who financed the prosecution, for having paid them."

Mr. Calhoun is president of the street railroad company. It was charged that he, for the company, paid \$200,000 as a bribe to obtain from the Board of Supervisors a permit for the use of the overhead trolley in the streets. The prosecutors had the confessions of several of the bribed supervisors, and it was for his connection with this transaction that Boss Ruef was convicted, in December last. It was alleged that parts of the \$200,000 were taken by Ruef and Mayor Schmitz, and that the remainder of the money was distributed in the Board of Supervisors by the board's chairman, James L. Gallagher. The latter had made full confession. There are more than a dozen indictments against Calhoun. In the one upon which he was tried he was accused of bribing Supervisor Nicholas with \$4,000 to vote for the overhead trolley permit. Nicholas had admitted that he received the money. The prosecutors sought to trace the \$200,000 from the beginning, alleging that it was sent from New York, was taken from the San Francisco Mint by Tirey L. Ford, the company's general counsel, and then paid to Ruef, Schmitz and the Supervisors. The trial consumed a little more than five months.

The Cuban Government on Saturday last published a statement concerning Spain's claim that Cuba should assume a part of the Spanish colonial debt. This claim was presented in Havana on May 27, when the Spanish Minister expressed the desire of his Government to make commercial treaties with Cuba. The reply is reported as follows:

"The State Department, after duly considering the note, replied on June 18 that the question having been settled in 1898, and the action then taken having been sanctioned subsequently by his Catholic Majesty, and Cuba's Constitution forbidding recognition of such a claim, Cuba must refuse even to discuss the colonial debt, although she was well disposed to negotiate a treaty to make closer her friendly and commercial relations with Spain."

The debt exceeds \$300,000,000, and it was incurred mainly in suppressing revolutions by which the Cuban people sought to gain independence.—It is understood that President Gomez has been officially informed that our Government is dissatisfied because the recent contracts for rifles and artillery were made in Europe, American manufacturers not having been permitted to bid. He has been reminded that Cuba really owes the United States several millions, the cost of intervention.

The Japanese Strikers in Hawaii

A majority of the Japanese who were arrested in Honolulu week before last have been held for trial, and nearly twenty more have been indicted and arrested. Among these are M. Negoro, editor of the *Jiji*, and three members of the staff of the *Jiji* and the *Nippo*. These Japanese papers have supported the strikers, and the four men are held for inciting the strikers to commit murder, owing to the evidence relating to their attacks upon Sheba, the editor of the *Shimpo*, a paper which has opposed the strike. Negoro was educated at the University of California. He has cabled a complaint to Ambassador Takahira, asserting that his office was searched and his private papers taken in violation of his treaty rights. He has also brought a charge of burglary against the sheriff. About 2,000 strike-breakers are employed in the places of

the workmen who are out. On the 17th, a convention representing the 9,000 Japanese workmen on the island of Hawaii voted that they would neither strike nor assist the strikers on the island of Oahu, but would ask for an increase of pay, relying upon the fairness of their employers. The Japanese Consul-General, Senichi Uyeno, emphatically opposes the strike, commending the attitude of the planters and advising them not to yield. In dispatches to Tokio he asserts that the disturbance is due to Japanese Anarchists who have organized the workmen for their own pecuniary profit. He approves the arrests made and says that the condition of the Japanese laborers would be improved by the conviction of the indicted men. So far as can be learned, the Tokio Government does not regard the disturbance as a matter of serious importance. It is estimated that the Japanese are now about one-half of the population of the Hawaiian Islands.

The Revolt at Davao

Since the recent revolt of a part of a company of the constabulary at Davao, on the southeastern coast of Mindanao, in the Philippines, no further disorder has been reported. One sergeant and twenty-two privates, all Visayans, mutinied and attacked the company's quarters, wounding a native officer named De Goicouria. This was in the night. Captain Allen Walker, governor of the province, at once gathered the resident Americans and the sixteen loyal soldiers of the constabulary in a large church, barring the doors and windows, making loopholes for rifles, and in other ways preparing for a siege. On the following day the mutineers attacked the church, fighting for three hours, but it was ably defended and they could not break in. The defenders were assisted by several American women, who were cool and brave in the face of danger. Word had been sent to another company of constabulary, stationed at Nati, 46 miles away, and when these loyal soldiers arrived the mutineers fled to the mountains, where, at last accounts, troops were pursuing them. One American civilian, named Libbey, was killed, and

four of those in the church were slightly wounded. In the attack upon the church at least one of the mutineers was killed. The cause of the revolt has not been reported. It is said that there were complaints about food. The authorities express great confidence in the loyalty of the constabulary. Davao is the center of a promising district, which American planters are developing.

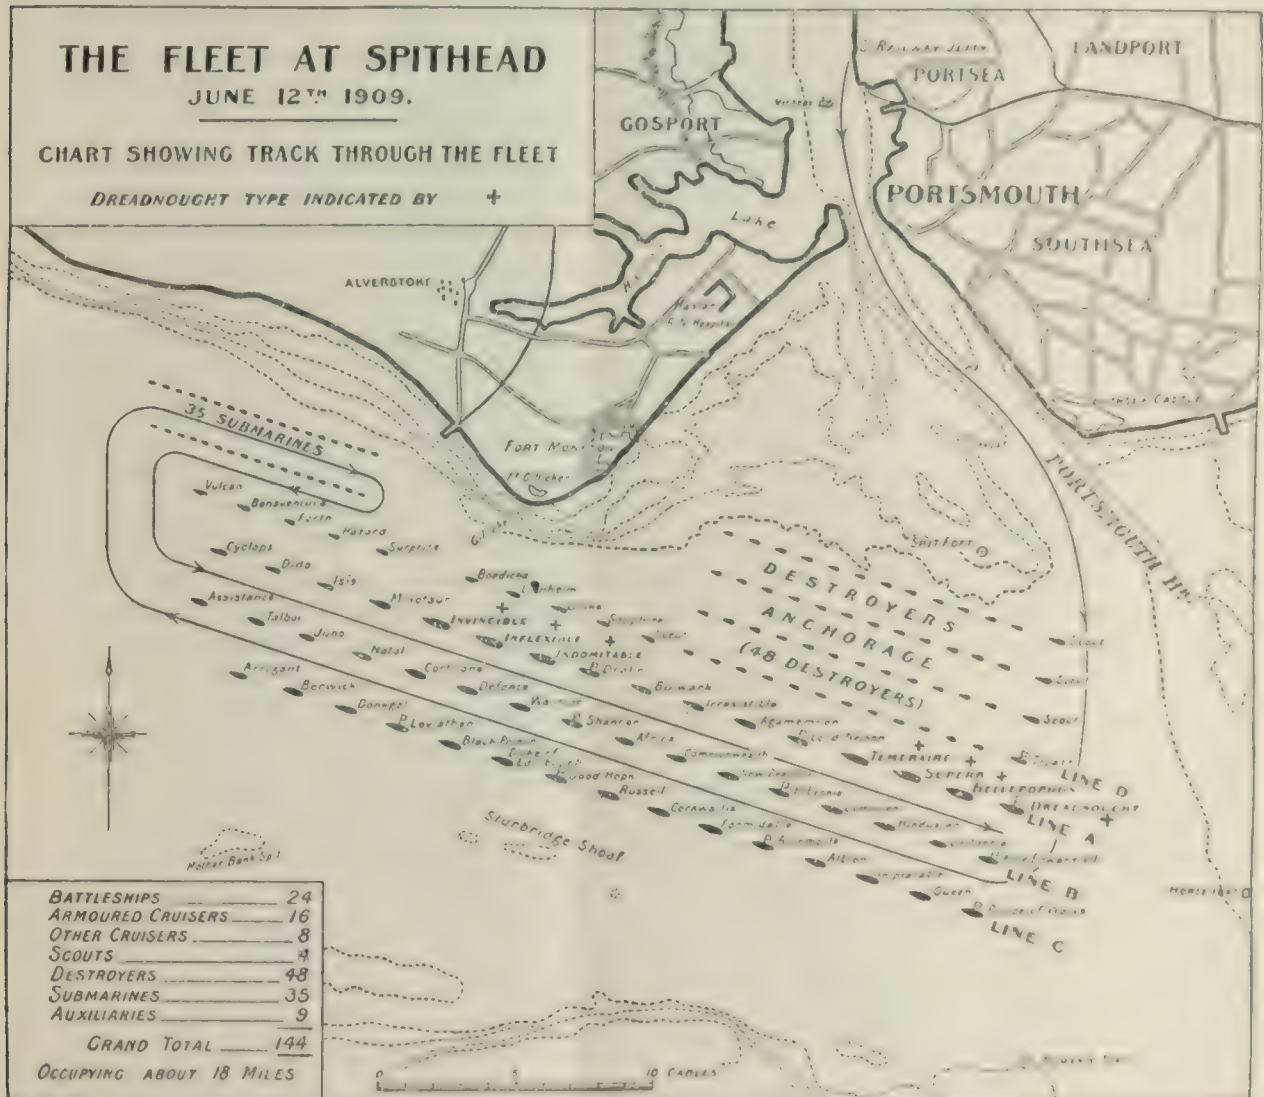

South and Central America

After she had been watched for several days by agents of three Washington Executive Departments, and blockaded by revenue vessels, the small steamship "Nanticoke" cleared from a port near Norfolk on the 17th, and went to sea with an escort of honor, in the form of the revenue cutter "Pamlico," our Government thus making amends for its suspicions and surveillance. Inspection showed that there was nothing contraband in her cargo. All the stories about piano boxes full of rifles for Castro's men were forgotten. As we said last week, she has been purchased by the present Venezuelan Government to be used against a Castro navigation monopoly on Lake Maracaibo.—Dr. Paul, Venezuela's special envoy to Europe, has sent to President Gomez a vigorous protest against his recent removal from office. He has had charge of the successful negotiations for a settlement of Castro's controversies with France, Holland and other European Powers.—A revolution is said to be at hand in Honduras, in the interest of ex-President Bonilla, who has been living in New Orleans. The cities of the north coast are reported to be in revolt against President Davila.—President Reyes, of Colombia, sailed from Santa Marta for England on the 13th, and it is said that he has given up his office in disgust. His support of the tripartite treaty concerning Panama was disapproved by a majority of the Colombian people. There are reports that he narrowly escaped assassination in Cartagena. It is said that he will return only in response to a popular demand, or if a revolution should take place. Vice-President Holguin, who holds the office in his absence, is his intimate friend.

The British Finance Bill

The debate in the House of Commons on the finance bill is very interesting even to foreigners, because it is not so much a discussion of the specific proposals as of the fundamental principles of taxation. The Opposition calls it a vindictive budget and charges the Liberals with making an attack upon their chief enemies, the liquor and landed interests.

laid upon distilled liquors will cause beer to be generally substituted for them. In England about \$17 per individual is spent annually for alcoholic liquors; in Scotland \$12. The Opposition points out the difficulty of assessing the value of undeveloped minerals and one speaker suggests that the only way to do it will be to provide every tax gatherer with a divining rod. But the chief attack on the bill

THE STRONGEST NAVY IN THE WORLD.

The Atlantic Squadron of the British fleet as reviewed by the Imperial Press Conference.
From the London Times

"Vote for us or we will tax you out of existence" is alleged to be their policy. The increased burden laid on the distilleries has cost them the support of the Irish members and alienated some of the Scotch. The Government is charged with inconsistency in taxing whisky, beer and tobacco as luxuries and letting other luxuries go free. The measure is defended on the ground that there are widely diffused luxuries which can easily bear an increase; that the heavier burden being

is directed against the proposal to levy a tax of 20 per cent. on the unearned increment of land whenever it is transferred. The argument of the Opposition as expressed by various speakers is that this is robbing Peter to pauperize Paul; that it is impossible to assess the site value of land as apart from its improvement; that if the Government takes away from the owner part of his profit when the land rose in value it should reimburse him for part of his loss in case it decreased in

value; that if, as the Lord Advocate had said, "the land as distinct from the improvements upon it belongs to the nation," why not take it? Why take only a fifth of the increase? "The law officers of the Crown were actually compounding a felony." It was further argued that land does not differ from other wealth in owing its value to the community; that physicians' fees were greater and authors sold more books than formerly because there were more people, and that this "unearned increment" must also be taxed to be consistent. In reply to this the Government speakers held that the distribution of wealth thru the old age pensions and the like was more beneficial to the community than its distribution thru the extravagant expenditure of the rich; that, so far from its being impossible to separate ground rent from the rent on improvements, it was a matter of daily calculation in real estate dealings, and that the city of New York has had no difficulty in applying such a system of separate assessment; that it is an absurdity to hold that the taxation of any form of profit involves compensation by the Government when there is a loss, for example, everybody approves of the income tax (in England), but in case a man has no income the Government does not give him one; and that

Land differed from other property in several distinctive features, its existence did not depend on the owner, it was limited in quantity, it was absolutely essential for the existence of the community, and it owed its value to the community and not to the owner. In so far as it did not it was not proposed to tax it. Lastly and by no means least in the view of the tax collector immobility was a distinctive feature of this property, and the taxation could not be avoided.

The Meeting of the
Czar and Kaiser

The conference of the Emperors of Germany and of Russia concluded on June 18 with a banquet on the Russian imperial yacht "Standart." Nothing is known of the political results of the conference but it is assumed that the conversations of the two sovereigns and of their foreign secretaries, Isvolsky and Schön, related chiefly to the Turkish difficulties in regard to Crete and Bulgaria, and to the Russian military occupation of northwestern Persia. An unfortunate incident occurred during the conference when a

British lumber steamer, the "Woodburne," coming out of the harbor of Fredrikshamm, Finland, was fired upon by a Russian torpedo boat. The vessel was in charge of an authorized Finnish pilot, but it appears to have gone within the lines reserved for the royal yachts or at least to have headed in their direction. The torpedo boat fired three blank shots as a warning, promptly followed by four projectiles. A four-inch shell struck the "Woodburne," wounding a British fireman and slightly injuring three others. The fireman was sent to the hospital and has received a gift of \$100 from the Czar. The affair has caused very little public excitement in England and has been mentioned in only one Russian paper.—The Czar intends to visit England before long on his yacht and later France and Italy. The Socialist members of the House of Commons have violated international courtesy by denouncing and even threatening the Czar on his coming visit. A meeting of protest will be held by the Socialists in Trafalgar Square on July 18.—The President of the Duma, and fifteen Deputies and five members of the Council of the Empire have left St. Petersburg for a visit to London, where they will be entertained by the King, Lord Mayor and members of Parliament. While this visit is unofficial, the delegation is of a more important character than that which visited England in 1906, which was composed of the Radical members of the dissolved Duma, while this includes representatives of various parties.

The desire of China
The Chinese Loan to borrow \$27,500,000 for railroad construction

has caused a great deal of financial and political wrangling in Europe during the past few months, for German, French and English financiers insisted upon having a share in the loan and invoked the aid of their governments to secure it. Finally the matter had been arranged to the satisfaction of these three nations, and of China, when a protest was interposed by the United States in behalf of its own money-lenders. The protocol of the agreement had been already signed on June 6, but had not been confirmed by imperial edict. According to this agreement the loan of

five and a half million pounds sterling was to be divided equally between German, French and British banks, the price to China to be 95 and the expenditure of the funds to be under the supervision of auditors appointed by the banks, while the Chinese authorities would have full control of the construction and management of the railroads. Of this fund \$2,500,000 was to be devoted to the redemption of the bonds sold to Belgium by the original American concessionaires of the Hankau-Canton Railroad, and the rest spent in the construction of the railroad. The northern portion of the railroad was to be constructed under a British engineer-in-chief and the southern under a German engineer-in-chief. When the American Chargé d'Affaires, Mr. Fletcher, protested to Grand Councilor Chang Chih-tung, who had charge of the negotiation for the loan, he was informed that it was too late to reopen the question. Mr. Fletcher insisted upon America's right to participate in the loan on the ground that China had agreed in 1904 not to conclude any foreign loans without consulting Great Britain and the United States. Ambassador James Bryce has expressed to our Government the desire of Great Britain that the American protest be withdrawn as the agreement had been concluded after prolonged and delicate negotiations and it would have a very bad effect to repudiate it. The French Government has taken the same position. German banks also resent the intrusion of the Americans, but so far the German Government, anxious to maintain good relations with the United States, has declined to give them official support.

French Affairs

England is not the only country where the financial question is a grave one. The French budget for 1910, several months overdue, has been at last presented by M. Cailiaux, Minister of Finance, and bears evidence of some hard thinking on the part of the Cabinet. A deficit of \$21,000,000 is manifested, of which \$9,000,000 is postponed to the next year. To cover the rest of the deficit the Government proposes a new tax of a cent a liter on gasoline for automobiles, a dog tax, and stricter enforcement of taxes on colonial obligations and mines, and a new inher-

itance tax. For the proposed system of workingmen's pensions it will be necessary to levy still heavier taxation on capital. The law for this which was passed by the Chamber of Deputies two years ago is now under discussion in the French Senate. It provides for a contribution from the workingmen supplemented by the employers and by the state. The pension bill for railway employees is farther advanced, but may be held up for the purpose of incorporating it with the general pension system. The Minister of Public Works, however, holds that railway servants play so important a part in the economic life of the nation that they merit special treatment. If the Government, however, continues its policy of taking over the railroads, all these employees will in time have the same status as the postmen and other civil servants. The railroad pension bill, as amended by the Senate, places the age limit for pension at fifty years in the case of trainmen and fifty-five for the office force. The total cost of the pension system when in full operation is estimated at \$7,000,000 a year, for there are about 308,000 railroad employees to provide for.—The Government naval program, about to be presented to Parliament, involves an expenditure of \$600,000,000, covering a period of ten years. Six battleships of the "Danton" type, six of the "Republique" type, and four armored cruisers of the "Gambetta" type are included in the estimates.—The decline in the birth rate, which has caused so much anxiety to French economists and moralists, has apparently been checked. In 1907 the deaths exceeded the births by 19,829, while last year there were 46,441 more births than deaths. In 1908, forty-five departments showed an excess of births over deaths, compared with twenty-nine departments the year before. The Paris district is one showing an excess of births. The actual increase in the number of births over the whole country amounts to only 18,067, for the gain in the population is largely due to the fall in the death rate, which shows a decrease of 48,266 below that of 1907. The number of marriages celebrated in 1908 was 351,928, a larger number than any year since 1873. Divorces have increased from 10,038 in 1907 to 11,515 last year.

MT. RAINIER AS SEEN FROM THE DOME OF GOVERNMENT BUILDING.

The Exposition

BY MATEEL HOWE

[Our readers will remember a previous article in *The Independent* by Miss Howe, entitled "How an American Girl Made Up with the English." Miss Howe is the daughter of the editor of the Atchison, Kan., *Globe*, and has already had many articles printed in the magazines. As she lives in Portland, Ore., we asked her to go to Seattle and spend the summer week at the Exposition, so as to write the following article.—EDITOR.]

I HAVE seen six expositions, all told, and have got so tired and weary at all of them that the very thought of an exposition, as a rule, brings on a headache, backache, footache, eyeache, and a bad humor generally. But when I arrived in Seattle on the afternoon prior to opening day I, contrary to all expectations, was in a very good humor and expecting to have a very good time. Half a dozen letters preceded me and heralded my arrival to the management of the hotel where I had elected to stay, and I had been assured from the owner of the hotel—who is also president of the Exposition—down to the assistant clerk or something, that I should be most carefully looked after and given special at-

tention. When I announced that I intended to visit the fair, everybody I knew or even met casually knew somebody who had a position of trust in the hotel, and they, one and all, insisted on writing to their influential friends about me. As a consequence and result of all their combined labors I was given a small back room with bright cerise walls and red carpets, situated almost on top of a huge steam shovel that operated all night long and made sleep, like politics, an iridescent dream. So my first view and impressions of the Alaska-Yukon-Pacific Exposition were very much colored and distorted by that clanging, shrieking monster, and it was not till after several days of rest and quiet that I could forget

my troubles and see things as they were and are.

To me all expositions look more or less alike on the outside, differing chiefly in point of size and beauty. The Alaska-Yukon-Pacific Exposition—A-Y-P for short—belongs away down the list in point of size but away up the list in point of beauty. Taken as a whole the general effect is beautiful. The buildings, of a deep creamy restful tint, are arranged in a circle around the Grand Central Court—what would an exposition do without a Grand Central Court?

The Government Building is at the head of this court, and the view from there is very lovely. On all sides of the buildings and the grounds and directly in front is a series of cascades, ending in a circular basin with a geyser fountain. From here are gardens making an outlook to the foot of the grounds, where lies the beautiful timber-bordered Lake Washington. In the distance, many miles away but seeming very, very near, is the massive snow-covered Mt. Rainier. This makes a vista worth while looking at, and the fact there is always a group looking shows that others agree with me. Of course, at night the cascades are flooded with colored electric lights—just as at all fairs. Even when there is a

glorious shining moon to silver the waters, the blue, green and red lights still flash off and on at intervals and put the moon quite to shame with their gaudiness. But falling and splashing waters are always pretty, even when they are reddened and greened and blued, and so the cascades are always good to see. The largest buildings border this court and the others fall in behind.

The architecture is universally good and the general effect is very pretty. Pretty seems the right word to describe the fair. It seems right to apply the word "pretty" just as at St. Louis the word "stupendous" seemed best. It is a pretty little fair—perhaps even a beautiful little fair. Certainly, it is very, very pretty.

The Lewis and Clark Fair, at Portland four years ago, was not so large as the A-Y-P nor quite so pretty. The Pan-American Exposition was larger than the one here, but not half so pretty. It seems absurd to even compare this with the World's Fair at St. Louis, and yet as others do so shall I. But that at St. Louis was a world's fair, and all the civilized and semi-civilized world was represented. It was so huge that one could not see it all in a month, even if he went to work conscientiously to sight-see and

THE FINE ARTS BUILDING

GENERAL VIEW OF THE
EXPOSITION GROUNDS, PORTLAND, ME., 1894.

kept at it. The Agricultural Building there could almost have held all the buildings of the Seattle fair. There, every State had a magnificent building as well as the foreign countries. Here, Japan and Canada are the only foreign countries represented, and but six States have buildings. There, one took a trolley to get from one part of the grounds to another. Here, one walks or takes a wheeled chair. There is nothing overwhelming in the least about this Exposition. But it does not represent the world or even the United States, but just a part of the great Northwest. Considering what it does represent it is in every way creditable. But it should not be compared with the fair at St. Louis any more than a county fair should be compared to it. And yet, since we have compared, I must say I think this fair prettier, even, than the huge one at St. Louis. Its grounds make it so.

Out West, when they build fairs, they do not go to the edge of the city and find a few vacant lots, tear down numerous buildings and erect a fair as in the East. They go out in the timber and cut down trees and erect their fairs in the cleared spaces. The trees still crowd the cities of the Northwest, and while there are no vast forests just adjacent, there are trees everywhere, and every uncultivated spot is covered with the forest monarchs. So

when Seattle built her fair there were trees to cut down and growing things to clear away. But wherever a tree was wanted it was left. Wherever the architect, and he was a good architect, wanted a background of massive firs, he left them there. In the grounds he wisely left much of the natural shrubbery and tender young trees and bushes. Moreover, this is a fresh, green country where it rains much, and the foliage and grass and flowers reach a marvelous perfection. There is room here, too, lots of room, so the buildings are not crowded together, and nearly all of them are set in beautiful lawns. There are flowers everywhere that only the West, outside of the tropics, could furnish. I said the fair was pretty. Perhaps I should say beautiful. Certainly the grounds and surroundings are beautiful, and one cannot but grow enthusiastic over them. The flowers are not in set beds or formal gardens, but scattered everywhere. They are just beginning to bloom now, and unfortunately the pictures do not show them as they should. Unlike other fairs, the grounds are not cheapened by numerous and hideous imitation statues and plaster of Paris cupids and dryads. There is absolutely none of this and the relief is great.

No fair ever had a lovelier setting than this one. Portland's, too, had a beautiful

EXPOSITION BUILDINGS.

European Building, and Philippine Building. Geyser basin in center.

location, and the trees and flowers were its chief charm. The Exposition is about twice the size of the Lewis and Clark Fair, and the buildings are of a much better style of architecture. In St. Louis one carried away an impression of massiveness; in Buffalo one remembered chiefly the illumination; here the principal charm and lasting impression is of the beauty of the surroundings and of the trees and natural gifts that make the Northwest so fascinating.

At night the charm of the fair is lost. There is no Niagara near to furnish unlimited power for illumination and make a fairyland of it as at Buffalo. It is illuminated, to be sure, and the buildings outlined with lights, but that feature cannot be compared to Buffalo's any more than the grounds at Buffalo can be compared to those here.

I am dwelling chiefly on outside charms, because there is not much to be seen inside the buildings. It is early, of course, and some of the exhibits are not in place, but it is not too early to judge of what they will be. The Government Building is quite finished and is interesting and instructive to all those who have never seen a government building. But having seen one you have seen them all, and I have seen the models of ships and of lighthouses, and pictures of the Yellowstone, army uniforms, historic flags

and Filipino villages in miniature very often. I had the advantage of seeing the fair with a friend who was new to fairs and she found much to interest her in this building, especially in the old bills and legal documents. I think a small fair fails chiefly with its exhibits. At St. Louis there was so much to see. The foreign governments sent their most wonderful and beautiful treasures and built models of historic palaces to show them in. Here practically the only foreign exhibits are very mediocre displays by very small shopkeepers, who make a business of following fairs. Japan, for all her war talk, has the one foreign building excepting Canada's, tho it is not yet open. It is a very interesting building, however, and the Japanese displays are nearly always sure to be good. Japan had by far the finest exhibit at St. Louis of any country represented there. The Filipinos have a small, but interesting, building. Hawaii, too, has a building, but none of the exhibits are yet in place. The Alaskan Building is large and the exhibits interesting if one cares for Indian baskets, curios and pictures of scenery. The art gallery, tho small, is excellent. This is probably the second best feature of the Exposition. No exposition need be ashamed of the collection shown here. The pictures are few but of the highest quality. Botticelli, Romney,

Lely, Rembrandt, Turner, Millet, Bernet, Lorraine and Van Dyke are names found on one page of the catalog. There is an excellent showing of the famous Barbizon school, and others from Americans past and present.

The Art Gallery is one of the permanent buildings that will be given to the University of Washington as soon as the fair is ended. The university, by the way, originated and started the idea of

climb so far heavenward and grow so big that apple trees and maple seem like bushes in comparison.

The Forestry Building, even on opening day, was completely finished and ready, as were most of the buildings. This fair was not postponed one day, and it was wonderful to me how complete everything was. The grounds were in perfect readiness and there was no crudeness of preparation apparent. The

THE FORESTRY BUILDING.
Built of Washington timber.

the A-Y-P, and fortunately will profit by its energy. The university is adjacent to the fair and all the fair grounds will be part of the university grounds after September. Another building that will go to the university is the Forestry Building. This is probably the most interesting building on the grounds to Eastern visitors. It is built entirely inside and out of massive logs in their natural state, and is not only impressive and different but beautiful. It will surely make going to school more pleasant, for it seems like a large club house where one would naturally have a good time. This Forestry Building is not unique with the A-Y-P, however, for they had one in Portland at the Lewis and Clark Fair, and still keep it in their midst to show admiring visitors from back East, where fir trees don't

Midway, called the Pay Streak here, was probably less ready than any other part of the grounds.

I fear old age has overtaken me at last, for I am unable to get up any enthusiasm whatever for Midways, Pikes or Pay Streaks, or whatever they may be called. The Eskimo Village and the Tickler, the House Upside Down and the Magic Maze have long since ceased to appeal to my sense of humor. No longer does it cause me any beautiful creepy thrills to whirl madly around dark corners on scenic railways and suddenly plunge downward a few hundred feet. The "Spielers" used to amuse me very much, but either it is the afore-mentioned "old age," which has prejudiced me, or the shows have chosen very mediocre performers to cry their wares.

Aside from the Igorrote Village the Pay Streak is not what one might expect, nor is it to be compared to any of those in the Eastern expositions. Its chief lack is a first class cafe.

My ideas of a good time at an exposition is to take dinner out of doors in the evening in an unique and artistic cafe where there are crowds of people and good things to eat, good music and singers. One gets so tired and hot and "achy" doing a fair, that in my opinion it is an actual duty of the management to see that there is at least one absolutely first class and attractive cafe where one can rest and eat and forget one's weariness. I remember a lovely little cafe in Buffalo, and there were many in St.

profusion down town, on the hills and out near the grounds. I tried one down town with disastrous results, and I should advise any one coming to see the fair to try an hotel up on the hills or out on the grounds. When inquiring for accommodations be sure to ask about excavating. Seattle, looking forward a hundred years or so and getting ready for the population she expects to have then, is leveling hills, tearing down streets and opening up others. This is all very pleasant for the coming generations, but a bit hard on weary fair visitors unless they are used to excavating and have a fondness for steam shovels. If not, I strongly advise an hotel rather far out! I stayed at one on a hill about eight

MUSIC TEMPLE.

It is pure Colonial in style and commands an impressive view of the Formal Gardens and the Court of Honor.

Louis, to add to the joy of things. The New York Building, always the center of hospitality, has a pleasant restaurant attached, but this is not open to the general public.

But as one can see the Alaska-Yukon-Pacific Exposition in two or three days at the most, not many meals are wanted, and there are plenty of good hotels and cafes down town. There are hotels in

blocks from down town, and not the least pleasant part of my visit has been the glorious view of the glorious Puget Sound and of the sunsets, that each evening put to shame even the wonderful Turner out in the Art Gallery.

In the East they often speak of Roosevelt's luck. Out West we talk of Seattle's luck. So every one expects Seattle's first exposition to be a great success

before the summer is over. It opened gloriously with most perfect weather. Several regiments of the army were here, most of the Pacific Squadron and two Japanese warships, to help in the opening. One of the interesting sights of the exposition has been the slant-eyed sailors wandering around the grounds hand in hand, and having such a good time that they made even the weariest feel better.

I have said all expositions are alike, but the A-Y-P is unique in one particular. It does not represent anything past, but stands for the Alaska and Pacific of today and of the future. It does not

commemorate anything that has been done but things that are expected to be done. This makes a step forward in expositions and Seattle should be proud to be the pioneer. She has built a fair in every way creditable. It is a pretty little fair, certainly, and the country about, the mountains, the ocean and the mystery-brooding forests make it even a beautiful little fair. Nature has been kind to the Alaska-Yukon-Pacific Exposition as she has been kind to Seattle. A visitor, especially one from the East, will never forget the fair here, and chiefly because of the beautiful setting it rests in.

SEATTLE, WASH.

'The Puget Sound Region

BY RICHARD A. BALLINGER

THE SECRETARY OF THE INDEPENDENT AND EX-MAYOR OF SEATTLE

PUGET SOUND is the great Mediterranean Sea of the American Continent. It is a vast inland waterway, and with its inlets and bays furnishes a world harbor which calls for no aids to commerce except ships and docks.

It is destined to command a larger measure of trade and commerce than any similar body of water in the world. It lies wholly within the State of Washington; its shore line, exclusive of that of the Strait of San Juan de Fuca and the

villages and lumber mills. Its shores now contain a population of a half million people. The commerce and principal cities are reached by four transcontinental railroads and a fifth will shortly be added. It is nearly eight hundred miles nearer by sailing course on the short circle to Hongkong than San Francisco.

The entire western slope of the Cascade Mountains, through which Puget Sound enters, far up toward the Columbia basin, contains a remarkably valuable growth of merchantable timber

of approximately two hundred billion feet of lumber. Lying between Puget Sound and the Pacific Ocean are the Olympic Mountains, unparalleled for scenic beauty. In the Cascade range stands Mount Rainier, at an altitude of 14,520 feet.

archipelago of islands known as the San Juan Islands, is 1,135 statute miles in extent. The shore line of the islands of the San Juan archipelago is approximately 310 statute miles, and that of the Strait of San Juan de Fuca, on the American side, 100 miles. Its depth of water in the principal channels and harbors makes it accessible at all times to the largest vessels afloat. It lies within a temperate region, always free from extremes of the elements. Twenty-five years ago on its shores was but a sparse population, principally fishing

1—The Imperial Limited. The train is ascending to Selkirk Summit, on the Canadian Pacific Railway, Selkirk Mountains, Canada.

2—Mt. Stephen. One of the Rockies seen from across the Kicking Horse River, Field, B. C., Canada.

3—Cantilever Bridge, over the Fraser River, near Cisco, Canada.

Flowing from the Cascade slope on the west into Puget Sound are abundant rivers containing water power of inestimable value and sufficient for the needs of the highest possible commercial development. The Cascade Mountains are rich in mineral, containing gold, silver, copper and other minerals, and there is also a large area of coal deposits. Tributary to this region on the east, across the Cascades, are some of the most fertile lands on the continent, semi-arid in character and partially irrigated. These are considered an important element in the future commerce of the Northwest. The lumber mills at various places on Puget Sound, such as Bellingham, Everett, Seattle, Tacoma and Port Blakely, without doubt cut more lumber than any other mills in the world; the greatest shingle producing mills of the world are

located in the vicinity of Seattle at Bel-lard.

Considering the advantages in wealth of timber, minerals, fisheries and agriculture, in conjunction with climatic conditions, rail and ocean transportation Puget Sound is the most favored station for the development of trade and commerce upon the continent. Its rapid development has brought to its shores a class of industrious and capable citizens, fully appreciating their natural advantages and possibilities. In this land—its breadth of ocean and plain, its lofty mountains—the grandeur of Nature's plans enlarges the mental vision and activities of the people who are continually associated with these conditions; hence they are bolder and broader in their undertakings, and thereby human energy is vastly intensified. The new fields of

activity, limitless in their possibilities, tend to widen the scope of individualism and to develop a type of manhood commensurate with their physical surroundings. Of all portions of our country there is none in which life is more intense and business more active.

Twenty years ago this coming winter the writer reached Puget Sound by way of Vancouver, B. C., sailing on the "Islander" to Seattle, a city just rising "phoenix-like from the ashes" of a great conflagration. From Seattle I proceeded to Olympia, the capital of the new State, on the small steamer "Fleetwood." I arrived at the capital at night, at what was known as the "long wharf," at which landings had to be made when the

tide was out. I had a traveling man as companion. We went ashore and walked something like a mile before reaching the town. My companion remarked that "this was the first inland seaport town he had ever landed at."

Olympia, standing at the head of Puget Sound, and because of the extreme height of the tides, is not always accessible to deep draft vessels, but by Government aid has been made reasonably so.

With the development of Oriental trade and Pacific commerce and the growth and development of Alaska, the possibilities of trade and commerce on Puget Sound are limitless.

WASHINGTON D. C.

The New President of Dartmouth

Professor Ernest Fox Nichols, D.Sc., formerly head of the Department of Physics at Dartmouth College and now professor of experimental physics at Columbia University, was, at a meeting of the trustees of Dartmouth College on June 8, unanimously elected president of Dartmouth, to succeed Dr. W. J. Tucker, who resigned on May 15, 1904, on account of ill health. Professor Nichols, altho not a graduate of Dartmouth, is an American born. He received his degree of Doctor of Science in 1903. Dr. Nichols was born in 1874 in Lawrenceville, Kan., and was graduated at the age of nineteen from the Kansas Agricultural College. Following a short period of teaching and research in physics and astronomy at Colgate University, where he remained six years. Under leave of absence he studied at the University of Berlin, where he made several important discoveries. In 1900 Dr. Nichols was called to the professorship of physics at Dartmouth. During the incumbency of the professorship of physics at Dartmouth, through his researches on the heat received from the sun, he discovered the existence of the most sensitive and delicate experiments of heat which have ever been made. In 1901, collaborating with Assistant Professor Hall, he discovered the pressure of a beam of light. His investigations in physics and astronomy have brought him many distinctions. His new appointment at Dartmouth belongs to the best class of scholars and his administration may undoubtedly be expected to be extremely beneficial to Dartmouth.

Alaska and the Yukon

BY JOHN G. BRADY

EX GOVERNOR OF ALASKA.

THE old saying, "Familiarity breeds contempt," does not hold good with Alaska; on the contrary, it begets a fondness which swells into enthusiasm as one fact after another is discovered and demonstrated. In some way or other the country has a drawing and winning effect upon most persons who have lived there, if only for a short period. Some are attracted by the beauty and magnificence of the scenery, and others find rest and returning vigor in the mildness and evenness of the climate; some, again, attracted by the wonders of the vegetable and animal kingdoms, and others, the majority perhaps, delve into the richness of the mineral treasures. The adventurers into British Columbia, the Yukon territory and Alaska are a hardy and buoyant stock. The Alaska-Yukon-Pacific Exposition will in large part tell their story. All Eastern people who are lovers of their country and who wish to become informed as to its extent and mightiness will make every effort to visit Seattle and not simply see, but study, the exhibits which have been gathered and displayed for a purpose. It will be accurate knowledge easily, cheaply and delightfully obtained. It is proper that these fairs be prepared as kindergartens for children of a larger growth, and for my part I should rather vote millions for world's fairs to enlighten and build up humanity than millions for armaments to darken and destroy.

Those who have gotten up our physical geographies were pumping from dry wells when they came to treat of the northwest coast of America. Much that was given was erroneous. For instance, Mount St. Elias in one edition of the Encyclopedia Britan-

nica is spoken of as a burning volcano. Many well educated people well along in middle life become impatient when the deficiency is revealed to them. It is well that this is so, for by a reasonable amount of diligence they can make good the loss and have much pleasure in acquiring in-

formation so much at variance with preconceived ideas. The Yukon is one of the mighty rivers of the globe. Captains who have had their training on steamboats upon the Mississippi and who now have been a number of years on the Yukon believe that during the months of navigation as great a volume of water is discharged into Bering Sea as into the Gulf of Mexico. Its headwaters begin in the mountains east of Skagway, in British soil, somewhat south of the sixtieth parallel, and flow in a generally northwest direction. Two branches, the Lewes and the Pelly, unite at Selkirk, at which point it takes the name Yukon. On its northern trend it receives the volumes of other large tributaries before Dawson is reached, near the mouth of the Klondike. Keeping a still northerly course it crosses the boundary line in lat. 141°, 90 miles from Dawson. Holding still its main direction at Circle City, it widens into numerous channels and great flats till a few minutes north of the Arctic Circle, where it is joined by the Porcupine, coming in from the northeast. Here it bends and takes a generally southwest course, gathering as it goes the Tanana, coming up from the southeast, and farther on the Koyukok, a mighty meanderer from the north, and at last discharging thru numerous channels over an immense delta into Bering Sea. It is navigable for large steamboats as far as Dawson, a distance of 1,000 miles. From

Thlingit Totem
Mangel, Alaska.

that point smaller steamers ply to White Horse, 112 miles by rail to Skagway. The summit is but 20 miles from this town and is at an elevation of 2,700 feet. This great river drains a mighty basin.

Many good things are found stored therein, and it does seem as tho the Creator intended it for the use of his creatures. Gold has been found on most every stream thruout the length of the valley where men have made an effort to reach bedrock, even far beyond the Arctic Circle on the headwaters of the Koyukok. The production of this metal, which influences mankind so powerfully, will be well illustrated in the Exposition. It will repay the visitor to give it more than a passing notice. Nature's mills have been grinding and reducing and sluicing in past ages; what has been sep-

thawing process in all its details well illustrates one of these.

Those who made for California in '49 had but one purpose, to dig out their pile and return to enjoy it. It was much the same with those who stampeded to the Klondike in '98. But California had many things beside gold; and of how much more importance have they been than the annual output of her yellow metal. The same will prove true with the Yukon and the other great valleys.

Right here I want to refer to the story of Prof. John Macoun, naturalist and botanist of the Geological Survey of Canada. In 1877 he was asked by the Premier to write a report on the capabilities of the Northwest. He found that the possibilities were unlimited and that it was only a question of the capacity of

arated from the lodes has been gathered and frozen securely in her safe deposit vaults. Nearly every camp has its own peculiar gold. There is a wide difference in regard to shape, size, color and fineness. Dealers and miners become wonderfully accurate in these matters. Gold production in the north called for new methods, and these were introduced and improved upon year by year. The

the cultivators. They came and have shown their ability to do things. Manitoba demonstrates what Professor Macoun pointed out in 1877. Again, in 1902, it was suggested that this same man, in the ripeness of his knowledge and experience, examine the Yukon country for his government. He did so, and in the following year, April 17, he gave his evidence before the select Stand-

BIRD'S-EYE VIEW OF NOME.

ing Committee on Agriculture and Colonization of the House of Commons. He reached Dawson, July 10, 1902. It is in lat. $64^{\circ} 15'$, which is about four degrees north of the northern extremity of the coast of Labrador. He found on that same day, July 10, red currants, blueberries and strawberries perfectly ripe on the hillsides, and even he was more than astonished. A species of rose which bloomed June 3 of that year 9 miles from Ottawa bloomed on the hillside at Dawson June 2 of the same year, as he was able to prove by a friend who had plucked the flower. He found one strange thing after another which upset all preconceived ideas and set him to thinking. He found beautiful spruce 10 to 20 inches thru and 100 feet tall upon the exposed hillside; white spruce, the cleanest and most beautiful he had ever looked at. His study brought him to emphasize the fact that frost is an important factor in agriculture. It conserves the moisture in what would be a dry and arid region, and grudgingly but surely gives it up under the pumping influence of the sun's rays as they daily increase in intensity. How wonderfully wise it all is and how far removed from our previous conceptions of wisdom! As our living must come from the earth agriculture is of more importance to us all than any other industry. I am constrained to

quote the closing paragraph of his evidence: "Now this wheat (showing a sample) was grown in the Yellowhead Pass, 150 miles northwest of Edmonton, four years ago last fall. Now the reason I brought this up, gentlemen, is to show you this, that, according to my standpoint thirty-one years ago, that Edmonton was outside where you could raise wheat with safety. Now, here is grain raised up in the mountains 150 miles northwest. Now the Peace River country has been spoken of as unfitted for wheat raising by some parties. I tell you the Peace River country is well fitted; in fact, I reported the same year I was at Edmonton that the land in the Peace River country was better and better suited for grain than the Edmonton district. I wrote that thirty-one years ago, and it is true yet. Now, you will be considering railway matters. I am the discoverer of that Pine Pass, away up on the Peace River. I discovered it thirty-one years ago. Beyond that pass you begin to descend to the Pacific Ocean, and along there thru that part of the interior of British Columbia, I tell you, gentlemen, the day is coming when they will be growing any amount of grain up there, and away up into the Yukon. In my report on the Yukon that is just now being printed I have added 100,000,000 acres more to our available

FORT WRANGLE, ALASKA.

land for settlement than I could have twenty-five years ago, because our people are prepared now to believe it."

Since these brave words were printed our own agricultural stations have accomplished great things under the direc-

DOG TRANSPORTATION COPPER RIVER VALLEY.

tion of Prof. C. C. Georgson, a cultivated Dane. His annual reports are full of information. He has compared districts of Alaska with Finland, and feels sure that they can comfortably support a population of 5,000,000 souls. The exhibits of grasses, berries, vegetables, grains and mosses will be of the greatest interest to thoughtful visitors. The native grasses are abundant and nutritious. They mature their seeds north of the Arctic Circle; and where they cease the deer moss carpets the earth to the rim

will be one of the main purposes of the managers of the exposition to give the facts of rainfall, heat and cold, effects of ocean currents on the long coast line, and illustrate these facts in many taking ways to make them real and impressive.

Surely Alaska is a goodly heritage, and we now hold in grateful memory William H. Seward, Charles Sumner, N. P. Banks, yea, Andrew Johnson, because what was called "folly" has proved to be wisdom. The present population is small, possibly 35,000 natives and about

THLINGIT FISHERMEN, SITKA

of the frozen ocean. The possibilities for stock raising and dairy farming are almost beyond calculation. Sunlight and moisture sufficient for plant life are unfailing. The limits of this article will not allow even a brief discussion of other rich resources—furs, copper, lead, silver, tin, gypsum, marble, iron, coal, fish and timber. There will be exhibits of these to teach what has been accomplished and to arouse the interest of the incredulous. The climates of Alaska are not understood by Eastern people, and no doubt it

the same number of whites. The aborigines are a good stock, and with fair treatment and encouragement will do their full share in labor and development. They are doing it today in the fisheries, the logging camps and in the mines. We can hardly contemplate the history of our ownership of the vast possession for the past forty-one years with pride. In the main our conduct has been that of indifference and neglect. Altho under treaty obligation to maintain the Russian people who chose to remain, in the en-

joyment of all the rights and privileges of citizens of the United States, we kept up a military and custom house officer rule for seventy years. The civil code which became law in 1884 was, to put it mildly, a curious piece of statesmanship. Allow me to cite one instance. Senator J. P. Jones, of Nevada, because he owned an interest in the Treadwell mines, saw to it that all the mining laws and rights incident to mining were extended to Alaska in the organic act. A wise and salutary

act, for mining has gone on with no more difficulties than occur elsewhere. But

SEEK-SAHTEE.

the same act expressly forbids the extension of the land laws. The pioneer could get title to a mine, but not to a piece of land where he would chose to build a home. The coal land laws were extended in two or more acts, and yet after years of delay and millions spent in development and surveys and other expenses, titles for various reasons are withheld. There is not an acre yet surveyed, so that the pioneer homesteader who wishes to be assured of title when he complies with the

law, has no inducement to enter. The whole business is a disgrace.

THLINGIT LOGGERS, SITKA.

and perhaps the best way to cure it and atone for past evils is to cut Alaska off from the General Land Office at Washington and create it into a separate and independent land department subject only to the Secretary of the Interior and to Congress. A commissioner on the ground with young men under him would soon get the valleys marked out for ownership. The experience which Alaskans have had already with the General Land Office at Washington does not cause them to love it. Every acre of Alaska should be surveyed; the valleys first and then the higher altitudes. After learning the richness of the Seward peninsula it would be sheer rashness to assert that any acre at any level is worthless. Survey Alaska and let the people own it.

The next need is railway transportation. The whole southeast and southern coast has good harbors, which are accessible at any season, and for the most part rates are reasonable. But when one leaves the coast and starts inland the unit is no longer the ton, but the pound. At the road house 50 miles in from Valdez the price of oats and hay for your horse is 20 cents per pound. Alaska needs railroads, and it cannot develop without them. Trails and wagon roads serve their purposes, but how can such mighty resources be developed and distributed by such frail means? The world needs butter and beef, coal and copper, and railroads are a necessity in dealing with these things in Alaska. If

we have learned anything by the general agitation of railroads in the past few years, let Congress take up this vital subject of transportation in Alaska, where its laws are the only laws and are as direct and immediate there as in the District of Columbia. It has more warrant to aid and foster the building of a half-dozen roads thru Alaska today than it had when it first encouraged the building of roads across the continent. Let Alaska have the benefit of what has been learned. The people expect Congress to be as liberal and generous in railroad matters as it has been in the Philippines. The people want their roads for service, and are willing to pay generously, but they do not want to be taxed in every service to meet interest on millions which have not been spent. If these roads should be confined to transportation only now is the time for Congress to act. Surveying of the lands and railroad construction aided and founded on proper principles by Congress are the imperative needs of Alaska. Canada is wise and active. She has surveyed vast areas, and is bending her whole strength in railroad construction. Her agents are in our border States and are taking young American families by the thousands and money by the millions. It is time to make strenuous efforts to secure a part of these for Alaska. Let every one then who can visit the Exposition and learn something of the worth of our Northwest possession.

NEW YORK CITY

ALASKA SALMON BERRIES

Jesse James's Church Collection in Brasstown Valley

BY MRS. L. H. HARRIS

“**M**ISTER,” said Pappy Corn, as they sat under the horse-apple tree in Pappy’s yard, “did I ever tell you about the time Jesse Jeems took up the collection at old Zion Church?”

“No, you never did.”

“Brother Milam was our pastor then, and he’d been tryin’ for a year to raise enough money to put a new roof on the church, but it was like skinnin’ a flea for his hide and tallow. Sometimes he’d git a dollar, sometimes a couple of nickels. At last the old roof got so bad that the congregation mighty nigh turned Methodist from bein’ sprinkled and poured on so much. Milam ’lowed he’d make another effort the next Sunday night, and that he’d spend the week in special prayer that the Lord would see fit to open the pockets of his people in Brasstown Valley. Now, I ain’t sayin’ the Lord couldn’t t’ar a man’s clothes off of him if he had a mind to, but it’s one of my deepest religious convictions that human agency will do more to open a man’s pockets than prayer, and I wa’n’t expectin’ as good luck as usual this time, for some jackass had started the report that Jesse Jeems had been run out of Missouri and was hidin’ here in the valley on Liquor Ridge, and a heap of folks was afeerd to come out at night.

“Now, in them days, Tom Purcell, the one that run the sawmill down here in Brasstown Creek, was the wildest young rascal in the valley. He wa’n’t to say vicious, but just full of forked-tail mischief. This was why I had misgivin’s when he sent the message he did to Milam about the collection.

“‘Pappy,’ he says to me out there in the road on Saturday, ‘I hear the preacher aims to take another collection for the roof on the meetin’ house tomorrow night.’

“‘Yes,’ I says, ‘and I hope you’ll come prepared to do your duty, Tom.’

“‘Them’s my intentions,’ he says very

solemn, ‘and you kin tell the preacher he’ll git all he needs this time.’ With that he hiked off before I could ast him what he meant. And I reckon I would a thought no more about it if I hadn’t found, when I got down to the store, that he’d told every man in the valley the same thing. They was all speculatin’ and wonderin’ whether Tom was drunk or had got religion.

“Well, sir, you never see sech a crowd as was at old Zion the next night. Folks had forgot all about Jesse Jeems and they had all come out to see what would happen. Most of ’em thought Purcell had been converted and would give all the shingles hisself. And they were cranin’ their necks this way and that lookin’ for him. But he wa’n’t there.

“The service went on as usual ’till the sermon was over. Then Brother Milam closed the Bible, came down out of the pulpit and stood for a minute lookin’ at the congregation and combin’ his long white beard with his fingers.

“‘Brethren and sisters,’ he says very soft and tender, ‘you know how often I have tried to raise the money to put a new roof on old Zion Church, and you know how I have failed. I am here to confess that one cause of my failure was a lack of faith. I never had the courage to believe that I could get the money. But, brethren,’ he says, liftin’ his voice to a sort of anthem pitch, ‘I have spent this week in prayer, and at last it has come to me in a way that I can’t help thinkin’ is providential that we’ll collect enough money not only to put on a new roof, but to git a set of hymn books besides! For days I have had strange assurance, and when I came here tonight and seen so many more out than usual. I knowed the Lord was with us’—Milam was so good. Mister, any little thing would increase his faith to the miracle point. He was the only man I ever knowed that wouldn’t a been surprised if he’d drawed up a six foot angel in his

well-bucket, or if he'd opened the Bible and one of 'em had flew out in his face. I never shall forget the shinin' look he had that night as he turned this way and that talkin' to the congregation about his assurance, as if he'd got their promissory notes in answer to his prayers.

"He 'lowed for us to set and sing 'Am I a Soldier of the Cross,' and for every one that felt inclined, to come forward and lay his offerin' on the table.

"Well, sir, we were jest gettin' warmed up to the tune when I see the meetin' house door on the women's side open, and a man step in. He locked it, put the key in his pocket, crossed over to the one on the men's side, locked that and put the key in his pocket. Then he turned around and faced the pulpit. And I don't keer how the devil looks, he ain't a circumstance to this angel of the collection that Milam had foretold: he was seven foot high if he was an inch. His boot legs reached to his thighs, and there was a pistol stickin' out of the top of each. He had two more buckled around his waist and a couple of dirks crossed on his belly. His hair reached to his shoulders, and he had mustaches that drooped under his nose mighty nigh as long as another brace of pistols. His eyes showed thru a strip of black cloth like fiery beads.

"'Mister, continued the old man after a pause, 'did you know fear is ketchin' same as the measles or the eetch, only more so? It's a sort of natural contagion and when it gits started the bravest ain't proof agin it. There were men in that congregation that had faced the Yankee guns for four years without losin' as much color as they did that night in one jump, as they looked up and seen that highwayman at the top of the aisle. The singin' died away in the back of the house as if it had been quenched by a speret. Then the folks in front twisted around to see what was the matter, and it died away in front, all except Misses Lovin'good. She carried the tune half a line further before she realized she had it all to herself, but when she looked back and seen *him*, she give a squawk like a hen that has been jerked off her nest. fell back agin the wall and begun to have one of her smotherin' spells. Nobody could a moved to go to her if she'd been

dyin'. We were skeert stiff. It's the only time I ever heerd five hundred folks' teeth chatter at the same time, and it's a terrible nervous sound. Prim Mayberry, old Jonathan Snow and me were settin' together in the Amen Corner. Prim sings bass, and his face froze in that shape, and I was afeerd his eyes would pop out. Snow looked like an old man out of Genesis with his long white beard.

"'Goddllmighty,' he says, 'it's Jesse Jeems!' and with that he began to sink slowly out of sight. As for me, I was in the battle of the Wilderness, and I was at Gettysburg, but that was the first time I ever felt my 'life runnin' around inside of me like a skeert rabbit tryin' to git out.

"Mr. Jeems stood there with his back to the door two or three minutes, waitin' for us to git used to him. Then he took his hat in one hand, his pistol in the other and started the collection. There was a passel of young hill billies on the back benches that was always misbehavin' and lookin' sassy. Well, sir, they jest wilted like gals before that pistol and them eyes. But Mr. Jeems didn't seem to git in earnest 'till he come to the front rows where the deacons and pillars of the church were settin'. He fixt his eyes on Bill Lovin'good and drawed ten dollars out of him, five out of Clem Stollins, and so on 'till he come to where old man Snow had been settin' in the Amen Corner. Mister, did you ever see a dog pint a patridge in a bresh-heap? It was like that. There wa'n't nothin' showin' of Snow but his coat-tails, and they was layin' as flat almost as folded wings on the floor. Mr. Jeems didn't say anything. He jest stood there with the nose of his pistol about six inches from them coat-tails. Slowly they riz, parted a little, and we could see that Brother Snow was on his all-fours. Then his little hickernut head come up and turned on his long neck 'till his eyes met them of Mr. Jeems. His hand went into his pocket sorter like it was sleep walkin' and he fetched out a dime. Mister, I mighty nigh fainted myself at the expression on Mr. Jeems's face.

"'Durn it,' I says to myself, 'this is no time for Jonathan Snow to be economical!'

"But 'twan't worth while to worry. When Snow seen that congested look on

the collector's face, he drew out a roll of bills the size of your fist and let it fall into the hat. Then I'll be danged if he didn't drop back in a dead faint.

"The next minute Jesse Jeems tucked the hat under his arm, drew his other pistol and begun to back down the aisle toward the door. As it banged behind him I thought of Brother Milam for the first time. He was standin' right where he was when he give out the hymn, hadn't moved a muscle, but he had the look of one who has passed thru great tribulations.

" 'Brethren,' he says, very faint, 'We'll receive the benediction.'

" 'Long about twelve o'clock that night I heerd a knock on my door. Mister, my har sot up and my jaws clamped together so I had to speak thru my teeth.

" 'Who's there?' I says.

" 'It's me, Pappy, Tom Purcell.'

" 'I don't keer if it is, Tom,' I says, 'I'm sick, and I can't come to the do'.'

" 'I jest want you to see me a minute,' he says.

" 'I've seen enough tonight,' I says.

" 'I got somethin' for you,' he 'lowed.

" 'Lay it on the steps then. I wouldn't open that do' to the Angel Gabriel if he was to tell me he had brung me a harp and a golden crown,' I says.

" 'I heerd him snicker, and then the gate slammed. The next mornin' there was an old hat on my doorstep with three hundred dollars in it and a little piece of paper with these words wrote on it: 'For Brother Milam with the compliments of Jesse Jeems.'

"The old man paused and turned the wrinkles of his face into a thin smile.

"You wouldn't a knowed this valley next day after that collection. It was so humble and quiet. Nobody singin', nobody whoopin' and hollerin' as they drove along the big road. The fox hunters stayed at home and the fellows that roosted on Liquor Ridge got sober. The shadow of Jesse Jeems lay heavy everywhere. But when Milam and the deacons heerd about what I had up here, they come hot-footed. Snow was the first to git in, then Prim and Bud Sockwell hove in sight with Milam between 'em, and you may not believe it, but it took the deepest theological argument I ever made to git them fellows to accept

that contribution. Snow was plump rabid at the sight of his bills, laying like a bunch of crisp, green leaves in the old hat, with Mr. Jeems's compliments stickin' up among 'em like a white blossom. He 'lowed it wa'n't a collection nohow, but highway robbery, and he was for givin' back to every man what had been took from him.

" 'Snow,' I says, lookin' at him hard. 'You can't find a word in the Bible agin this kind of highway robbery, but there's a right smart said in it about usury.' He was knowed in them days to be a note shaver, and that little hint about money shet him up. But Milam was the hardest to convince.

" 'Brother Corn,' he says, lookin' shy at the old hat that was settin' on the floor in front of us, 'that wa'n't a voluntary contribution to the Lord's cause from the congregation; it was an involuntary contribution to a highwayman.'

" 'That's so, Parson,' I says, 'but you'll admit that Mr. Jeems is givin' it to you of his own free will and accord.'

" 'He didn't come by it honest,' he says.

" 'It's mighty hard for anybody to come by money that way,' I answers. 'money is something that has always been cheated out of somebody before you git it, even if you didn't git it that way yourself.'

" 'I can't feel right about it,' he says.

"A preacher is a curious phenomenon in the speretual world, Mister. He lacks what you might call moral agility. You never can tell when he'll plant the forelegs of his faith on some one of the Ten Commandments and kick up in the very face of Providence. Accordingly the only way to deal with him is as if he were a child, sorter coach him along thru the snares and pitfalls of this present world. So I looked at Milam as if he'd grieved and disappointed me.

" 'Parson,' I says, 'I 'lowed you was a man of faith. If anybody had told me that an old rapsalion like Billy Corn had more faith than his preacher, why, sir, I'd probably knocked him down for insultin' you. But in this matter, I'm obliged to think that my mustard seed has sprouted higher 'n your'n.'

" 'How is that, Brother Corn?' he asted.

"'Well, sir,' I says, 'You can't never tell what Providence will do nohow. And for me, I've got the faith to believe that the particular business of Providence is to get the best of Satan, and that He always does. It is written that all things work together for good to them that love the Lord, and it do. You jest watch an evil deed far enough and you'll see it hatch out something fortunate in the hand of a good man. Now, I don't claim that this here collection was took in an orthodox manner, but I hold that when it is applied as a roof to old Zion Church, it's bein' used for the benefit of them that love the Lord, and I ain't the one to fly in the face of Providence when He gives us sech a chance as this to purify tainted money,' I says, jumping up and stamping my foot on the floor to skeer the idea into Milam's heaven-befuddled head.

"Well, sir, he took to my argument like a babe do to its milk. He 'lowed I'd

put it so clear that he could see the hand of the Lord in it—he was that kind, jest obleeged to see the finger prints of Providence in everything, and I didn't dar' to draw the theological line between Satan an' Tom Purcell, and the providential provision for a roof on old Zion, for fear it'd onsettle his mind agin. But he wouldn't be satisfied 'till we had all knelt with him in prayer for that wayward son of God, Jesse Jeems. You never heerd anythin' kinder or more forgivin' in speret than the petition he made—Milam could set an example to the angels in Heaven at that. But when they was gone, I jest lay back in my cheer and laughed till I cried at the contradictory look on old Jonathan Snow's face. He groaned, but he wouldn't say amen nary time. I've never told who Jesse Jeems really was, beca'se I know Snow would have the law on him."

NASHVILLE, TENN.

Mars Must Die!

BY LYMAN R. BAYARD

UP the Olympian height proclaims a great and bitter cry
To startled gods, that Mars is not immortal, and must die!

For so the mighty Fates have willed; tho still the thread they ply,
The shears are ready-lifted now, and surely Mars must die!

No more shall myriad hate-filled men his murder-ranks supply,
Nor give their flesh to feed his life, for guilty Mars must die!

Prepare a monstrous funeral-pyre—great cities, flaming high—
Libations pour of bitter tears and blood, for Mars must die!

Behold the mourning cavalcade of warriors passing by!
Robbers and kings and captains grieve that mighty Mars must die!

Hark to his fitting funeral-song resounding fierce and high—
Wild battle-cries and oaths and shrieks and means—for Mars must die!

But all earth's brother-men unite in one harmonious cry
Of joy supreme, that war at last shall end, for Mars must die!

ELGIN, ILL.

Mombasa and East Africa

BY DANA ESTES, A.M.

[Dana Estes, head of the publishing house of Dana Estes & Co., Boston, and the author of "Three Thousand Miles Up the Nile," "The Adriatic and the Balkans" and "Roughing It in Rhodesia," died last Wednesday, June 16, in Brookline, aged 69. He had been ill about ten weeks, his health having become undermined thru the hardships which he suffered during his 2,500-mile African trip, from which he returned the latter part of March. Mr. Estes was a native of Gotham, Me., and went to Boston in 1859. He fought in the War of the Rebellion, enlisting as a private in the Thirteenth Massachusetts, and was wounded three times at the second battle of Bull Run. After middle life Mr. Estes, having founded and conducted three or four publishing houses, occupied himself with many outside interests affecting the development of greater Boston and began to indulge himself in foreign travel. His interest in archeology led him to visit the ruins of ancient cities. His home in Brookline is stored with unique specimens of ancient art, rare books and carvings. Mr. Estes was the first American to penetrate the Nile country to Uganda and the Kongo State. He was a member of the Bostonian Society, life member of the American Archeology Institute, American Association for the Advancement of Science, Boston Memorial Association and first secretary of the Pine Tree State Club. He organized the International Copyright Association and was its first secretary. He won the series of "Chatter-box" international trade mark lawsuits by which foreigners could secure copyright in some classes of American books. His wife and three sons survive Mr. Estes.—EDITOR.]

MOMBASA, tho the chief commercial port of British East Africa, and also, for the present, of German East Africa, belongs to neither of these great African Provinces. It is an appendage of the Sultanate of Zanzibar; but, fortunately for the British Government, Zanzibar is also under the protection and administration of the British Government.

Almost to the present time, the history of Mombasa has been a long record of quarrels and bloodshed. The native name, "Mvita," means war, and never was a name more justified by history. There can hardly be any town in the world which has been besieged, captured, sacked, burned, and razed to the ground so often, and in so short a time. In 1500 it was conquered and sacked by the Portuguese Viceroy of India. It was again captured and burned, after a siege of four months, by the Portuguese in 1528. It was taken from the Portuguese by a Turkish corsair named Mir Ali Bey, who ruled as an Ottoman Sultan. It was conquered, and the whole of the mainland near overrun by wild Zimbas, a tribe of fierce warriors from the South of the Zambesi, and it has been the prey of the rulers of Muskat and the Goanese from India, and the Mohammedan Turks. In 1635 the Portuguese, being in the ascendancy along the East Coast built the great fort of Mombasa, which still remains a monument of their relent-

less rule, which was one of the greatest tyranny, oppression and extortion, and has continued more or less the same down to the present time. Again and again have the natives revolted against their brutal and arrogant conquerors, and joined with the Arabs or Turks to drive them out.

Zanzibar has always been more or less associated with Mombasa, and the latter has been under the rule of the Sultans of Zanzibar many times during its varied history. In 1830 the first trading vessel from the United States of America visited Zanzibar, when Americans introduced their cotton cloth, which became known and continues to be known as "Mericanis," and which displaced the cowrie shells as currency, and became the standard medium of exchange among the natives of the interior of Africa, and continues to be the same, more or less, to the present day.

As, in the Augustan age, all roads led to Rome, so at the present time the thoughts of the reading public are centered on British East Africa, a country almost unknown but a very short time ago. It is a vast country of about 400,000 square miles, with an extensive coast line on the Indian Ocean, extending from the boundary of German East Africa, near the island of Zanzibar, to the borders of the Italian Somaliland, which is usually called Benadir, and thence inland and northerly to the undefined and not

delimited border of Abyssinia; westward it extends to the shores of the Victoria Nyanza, and northward to the comparatively unknown country lying be-

tween Abyssinia and the Sudan, including the region of the great Lake Rudolf. This country is penetrated by the famous Uganda Railway, built with great celer-

NAIROBI STREAM.

ity to cement the union of East Africa and Uganda with the other colonies under British protection.

Mombasa, altho the starting point of the Uganda Railway, and the great commercial port of East Africa and Uganda, is a portion of the Sultanate of Zanzibar, which is also under British protection. The traveler leaves Mombasa by this railway, the bridges and locomotives of which are of American construction. For a short distance after crossing the long bridge at Kilindini, the traveler passes thru an intensely tropical section of country near the shore, where he sees bananas and other tropical plants in their wild natural state. As the train ascends, the vegetation changes, and large forest trees are the distinguishing feature of the landscape. After a considerable distance of travel, the railway passes thru a waterless desert of great extent. It is not entirely devoid of vegetation, but supports only coarse grasses, shrubs, and the mimosa, which lives on almost any semi-desert land. The travel thru this section in the dry season is very disagreeable, owing to the clouds of red dust, which fills the cars and the lungs of the traveler. After passing for a long distance thru conditions of this kind, the Plains of Athi are reached. Vegetation changes again from the tropical regions, which produce cocoa, timber, India rubber, maize and rice, and where abundant crops of cotton, tobacco, sugar cane, spices, and other products may be grown. The Plains of Athi are almost wholly treeless, but the distinguishing feature is the vast extent of wild animal life. On the south of the railway is the great exclusive preserve of the Government, but on both sides the country is completely overrun with an astonishing variety of wild game. Here are immense herds of zebra and wild ostrich, who disport themselves, as do the other animals, in the immediate vicinity of the passing trains, and are comparatively indifferent to them. The chief feature of the fauna consists of a vast variety of gazelle and antelope. There are some fifty varieties of these animals, from the dainty and beautiful gazelle discovered by Thomson, the first explorer to carry an expedition from the Indian Ocean to Uganda, to the immense wildebeest, hartbeest, and an in-

finite variety of other animals of these species. The fiercer and shyer animals are seldom seen from the train, tho occasionally groups of giraffe, and now and then a lion, may be seen. Most of these fierce animals are hidden away in the jungle at some distance from the line of the railway. Among the most formidable and dangerous animals for the hunter to encounter is the wild buffalo. It is said to be far more dangerous than the man-eating lion. There are, of course, the amphibious animals, the hippopotamus, rhinoceros, and the immense water pythons.

The animals first spoken of have become so accustomed to the presence of mankind, and the passing of the trains, that for the most part they scarcely leave off feeding to watch the passing train. Occasionally some frisky young zebra or antelope will start off and run a little way and endeavor to create a panic among his companions, but they do not go to any great distance, and stop short, as our colts, calves and sheep do, to curiously examine the monster that is puffing thru their feeding grounds. Licenses are issued by the Government to hunt all of these animals, outside of the strictly preserve grounds, but a large fee, \$250. is required, and a careful report of every animal slain must be made to the proper authorities. Special facilities are offered to Mr. Roosevelt and his party, and doubtless the severe rules are somewhat relaxed in the case of such a distinguished visitant.

The Plains of Athi extend up to the local capital, Nairobi, and the writer saw wild animals quite within sight of the city. Nairobi is an exceedingly attractive city for one so young. It is said that the site was sold to a settler for some fifty pounds, and that he abandoned it to the Government, being unable to pay the taxes. It is now a very famous center; the railway administration and repair shops make a very considerable population. It is laid out with broad, fine streets, and it is almost impossible now to purchase sites in the city. They are held by speculators, who will let them on building leases, but discounting the supposed future of the town, are unwilling to sell. On the slight rise of hills around the town are very beautiful sites for sub-

urban residences. For the present, nearly all of the buildings, excepting some of the most important business buildings in the heart of the town, are built of corrugated iron in the bungalow style. They are, however, very attractive looking. Besides the Government buildings, Nairobi has a very good hotel. The great land owners, like Lord Delamere and Mr. William N. McMillan, an American explorer, have town houses in or near Nairobi.

The traveler is constantly entertained

their lives. A European officer was sleeping in his tent, together with his wife, when a lion pounced upon him, devoured him leisurely at a distance of a few feet from the tent—while the horror-stricken woman could hear the sickening crunching—and then came back for a long drink of water at the tub where the supply of water was kept. In spite of every precaution, including the construction of stout mimosa thorn zeribas, and a constant watchfulness around huge camp fires, the loss of life was very great dur-

MASAI WARRIORS FULLY ARMED

by the companions whose acquaintance he makes, with the hunting and other experiences of the wild animals encountered in the course of these journeys. The writer was told by a fellow passenger, an English captain, that during the construction of the railway the neighborhood of Voi was infested by a number of man-eating lions, so much so that the workmen threatened to strike *en masse*, as they were every now and then obliged to throw down pick and shovel and climb into a tree, and lived in constant fear of

ing the construction of the railway line. An extraordinary instance of the reckless daring of the African lion was related by Signor Parenti. Several years ago, the latter, together with an English officer and German gentleman, arranged a long shooting expedition to make a clearance of some very formidable man-eating lions which had carried off a great many of the natives. The railway was then in course of construction, so they started from Mombasa, and stopped halfway between Sultan Hamoud and Kiu,

where they were shunted in a carriage to a side track, and after fruitlessly exploring the neighboring jungle, prepared to pass the night in the railway carriage. Signor Parenti slept on the floor, while the English officer and the German stretched themselves out on the seats. It was arranged that the three should watch in turn, but during the night they all went soundly asleep. Shortly after midnight Signor Parenti was awakened by an overwhelming sense of oppression on his

chest, and discovered, to his horror, a lion had placed his hind quarters on his prostrate form, and was dragging away the Englishman in his powerful jaws. Next morning, the unfortunate officer's mangled remains were discovered far from the railway line.

Near the station of Kiu, which the writer passed in the early morn, he was awakened by his traveling companion, Mr. W. D. M. Bell, who is perhaps one of the most famous of all elephant hunt-

WILDEBEEST IN THE AFRICAN JUNGLE

OSTRICHES ON ATHI PLAIN, BRITISH EAST AFRICA

ers in Central Africa; he is credited with having captured the ivory of over 500 elephants. Being familiar with the line, he was on the lookout for a view of the magnificent mountain, Kilimanjare, and was eager that I should have the same pleasure. This splendid mountain is nearly 20,000 feet high, and is vastly more impressive than many other mountains of the same height, from the fact that it rises directly from a plain which is no great distance from the sea. It is

crowned with perpetual snow and glaciers, and I had the good fortune to see it under very peculiar circumstances. Below the snow and ice line there was a dark space, then followed a narrow rift of clouds; and again after that another dark space, and another rift of clouds; still below that another dark space, and another line of clouds; making the mountain a quadruple crowned mass. It certainly was one of the most, if not quite the most, impressive mountain view that

the writer has ever seen. Tho only some fifty miles from the Uganda Road, this mountain is wholly within the German territory of East Africa.

The climate of Nairobi and the whole plateau of Central East Africa is exceedingly comfortable and fine. It is an interesting fact that tho the fruits and vegetables of the temperate zones of Europe are successfully cultivated here, still the banana and other sub-tropical fruits also flourish.

The native inhabitants of Kikuyu and the other sections of the Athi Plains may be summed up as follows: Wakikuyu and Wakomba, of the Bantes Tribe, and the Masai. These tribes occupy well-defined zones, where villages are built and where they cultivate their fields, leaving vast surrounding tracts to the European farmers. At first the natives were extremely hostile to Europeans, but they now live on terms of friendship with the colonists, who are, however, forbidden to encroach upon the lands of the native tribes, in order to avoid danger of a clash.

Nairobi is well supplied with all the requirements of a new civilization, and has a large and very interesting native bazaar, branches of the Bank of India, and plenty of stores for the supply of agricultural implements and all other necessities of frontier life.

The railway line from Nairobi starts at an altitude of 5,450 feet, with an abrupt rise over the Kikuyu hills of 6,700 feet, and so on to the top of the famous Escarpment at a height of 7,390 feet. It is a marvelously picturesque country, well wooded, and for the most part capable of a high state of cultivation. It is at present largely occupied with immense cattle ranches. From the top of the Escarpment, the line drops into what is known as the Great Rift. Here commence not only the most extraordinary features of the line, but also some of the most beautiful scenery of the East African Protectorate. It is a sheer drop of 600 feet to Kijabe, which the train makes in a run of eighty miles. It continues to descend to Nakuro, a run of seventy miles, the place being about 6,000 feet above the sea. At Nakuro there is a semi-salt lake, a distinguishing feature of

this Great Rift, which, with the remains of shells and other indications, points directly to the fact that the Rift is a remnant of an ocean, in which the waters have become partially freshened. This great meridional Rift has a gorge which extends, in well defined limits, from the lower part of Central Africa, and includes the great Lake Tanganyika, in which are found salt-water shells, and which has, ordinarily, no outlet to the sea thru any of the great rivers of Africa. It was on this lake, at a place called Ujiji, that Stanley found the celebrated missionary explorer, Livingstone. Livingstone was strongly of the opinion that the Tanganyika was the true source of the Nile, that it emptied into a great stream running to the north, which afterward was proved by Stanley to be the great Kongo River. This Great Rift extends not only from the Tanganyika thru the country of the Mountains of the Moon and the Uganda to East Africa, but continues across the rest of the African continent and Arabia, and in it is included the extraordinary depression of the Dead Sea at Palestine.

From Nakuro there is an abrupt rise of about 2,200 feet, which is made by the railway in its series of levels, extending to every point of the compass. The sudden ascents and descents and the severity of the gradings make it one of the most interesting of all mountain railways. It differs from most railways of this kind in the fact that there is only one, and that a short, tunnel, on the whole line. From the Mau summit, 8,200 feet above the sea, there is an abrupt fall of 4,450 feet into the Province of Kisumu, in the great Central African plain. After traversing much beautiful territory, and much that is comparatively uninteresting, being timbered only with the mimosa, the train passes thru the fertile country of the Kavirondo tribes, a district thickly populated with peaceful and industrious people, who live mostly by agriculture and cattle rearing. It is a curious fact that these tribes, living in villages, persist in the custom of wearing practically no clothes whatever. They wear a few metal ornaments, and on great occasions paint their faces in the most hideous manner and adorn

themselves with splendid ostrich feather head creations, some of them being at least three feet high. They live near the Uganda tribes, who have always been celebrated, since their first discovery by Speke, the discoverer of the Victoria Nyanza, and the familiarity which grew out of Stanley's exploration of Uganda and dwelling for a considerable period there, as the best clothed tribes in all Africa; yet the Kavirondos, who live in their immediate vicinity, are practically

entirely naked; and, curiously, are celebrated for their moral characteristics and strict faithfulness to their marital relations.

The Uganda Railway terminates at Port Florence, and from this point fine steamers carry the travelers to the chief ports of Uganda, Entebbe and other places, and also make trips around the entire circumference of the lake, stopping at all the ports of German East Africa, as well as Uganda.

The Little Black Rose

BY SEUMAS MAC MANUS

IN a far land South does the Black Rose bloom,
And rich is the South with the sweet perfume
That the dallying white winds* wile and woo
From this flower of fragrance, *Rois'in Dubh*.

To nourish this rose drops the dew in the morn,
The linnet its praise lilts all day on the thorn,
And for it fond Nature spreads each gay hue—
And the sun himself smiles for *Rois'in Dubh!*

Oh, many and many a comely knight
Whose glance was bold, and whose lance was bright,
Rode into the South where the Black Rose grew,
But none ever came back with *Rois'in Dubh*.

For long and long have I dreamed of this Rose
That bends its black head where the white wind blows,
Till the heart in my bosom is burning to woo
The flower of all flowers, *an Rois'in Dubh*.

I'll journey forth, and I'll journey far,
No man shall hinder, no clan shall bar:
Thru forests of foes a high road I'll hew,
Or win my way to *Rois'in Dubh*.

I'll lay the black head where my bosom heaves,
I'll touch with my lips its quivering leaves:
It's South, and it's sun, and wind, and dew.
Then I'll be forever to *Rois'in Dubh*.

*In our Gaelic traditions the winds are personified. The South wind being personified as a woman, the Gaelic for "Little Black Rose" is "Rois'in Dubh".
4Pr. Roysheen dhoo. Gaelic for "Little Black Rose".
MOUNT CHARLES, COUNTY DONEGAL, IRELAND.

Literature

Socialism in Theory and Practice

MR. HILLQUIT'S volume* is the work of a man of affairs and not of academician. One misses, therefore, something of that intensive treatment of details and that closer and more harmonious adjustment of parts to each other which the detached scholar gives to a special study. Instead, one finds a wider outlook and a more sustained consideration of the practical relations of his subject to the workaday world. His reading has been exhaustive, and his experience with the movement long and intimate. He knows as few other men know the history of Socialism from the inside—the contests between schools and tendencies and their resultant effects, and the inner development of the movement at home and abroad.

The Socialist movement extends over the whole civilized world. It contains, no doubt, examples of every type of character. It has been, and to some extent is yet, the gathering place of vagaries of every sort, and every advance toward the crystallization of Socialist theories and uniformity of Socialist practices has been won by strenuous conflict within the ranks. Mr. Hillquit's breadth and sanity of view accords with the best Socialist thought thruout the movement. He has small patience with the speculative fancifulness or the capricious vagaries of the less disciplined Socialist writers and speakers. Socialism is to him a philosophy of social evolution; its causes are to be found and its development is to be traced, in relation to the economic foundations of society; it is a normal and continuous growth, retaining what is best in modern society, and discarding what is outworn, and though it is revolutionary in the sense that it aims at a complete change in economic relations, it is developmental in the sense that it grows gradually out of the conditions of the present.

Mr. Hillquit's chapter on "Socialism and the State" is an excellent illustration

of his method and his view. Engels and Bebel, followed by many of the German Socialists have contended that as the state was developed as an instrument of class rule, the abolition of class rule will inevitably abolish the state. Mr. Hillquit, however, finds in the state an instrument of social adjustment which cannot be abolished. "A social institution," he writes, "may be called into life by certain conditions and for certain purposes, but may gradually adapt itself to new and entirely different conditions and purposes. . . . The state, which came into being solely as an instrument of class repression, has gradually and within the last centuries, assumed other important social functions—functions in which it largely represents society as a whole, and not any particular class of it." With the growth and extension of social service, the need of the state must necessarily become more imperative.

The second part of the volume discusses the relation of Socialism to reform. The crude notion held by so many persons that strict party Socialists refuse to countenance reform measures, but instead wait serenely for the ushering in of Socialism by some mighty cataclysm, receives no support in these chapters. It is shown, on the contrary, that the Socialist party has always contended for every reform measure presumed to be of the slightest advantage to the working-class.

There is, of course, a distinction to be made between measures held to be beneficial to the working class and measures aimed against the aggregation of capital; and a further distinction is to be made as to the tactics of support. Socialists take no part in assaults on the centralization of capital; they regard this process as inevitable and as tending to hasten the final victory of Socialism. In the matter of tactics, moreover, they are a separatist party pure and simple. They believe the integrity and growth of their party organization a matter of more consequence than the adoption of any amel-

* *Socialism in Theory and Practice*, by Mr. Hillquit. New York: The Century Company, 1908.

iorative measure. As a consequence, they never sacrifice their party fealty for the success of such measures.

No one who wishes to know the philosophy, the aims and the achievements of the Socialist movement, stated by a man who is a prominent figure in that movement, can well afford to miss this excellent book.

Conquest of the Great Northwest

THE fascination of exploration and of the wild life of the wilderness could hardly be more vividly portrayed than in Miss Agnes Laut's *Conquest of the Great Northwest*.^{*} Miss Laut has prepared herself for her work, on the one hand, by wide travel over the great region which was the amphitheater of the adventurers of England, and on the other by persevering and careful work among the dusty old documents which are preserved in the archives of Hudson Bay House, in London; on the records of the Northwest Company, the reports of the Canadian Government, and in the letters and journals of the explorers, as well as by a good knowledge of "every book that has ever been printed on the early history of the Northwest." It is difficult to say which is the stronger influence in the writing—the scholarly accuracy of the historian who has diligently ransacked every possible source of information, and who guards every important statement with footnotes quoting her authorities; or the spirit of romance and adventure which Miss Laut has breathed in during her residence in Winnipeg, the old center of the Hudson Bay Company's operations, and her voyagings in Labrador and in other of the vast stretches of territory which even yet belong to the hunter rather than to the settler.

The story of the founding of the Hudson's Bay Company follows the account of the early explorations. While it would scarcely be correct to say that Miss Laut holds a brief for the Company, she undoubtedly champions it

against one of the aspersions which have been thrown upon it. She shows that the Company kept the vast territory of the Northwest for England against France, largely out of its own resources and with its own fighting men; and that its relations with the Indians, if not entirely above reproach, were yet on a better level than has usually been supposed.

Exploration was life and new blood to the Company. Exploration meant the discovery of new regions whence beaver, and silver fox, and all the other skins of lesser value might be drawn to enrich the coffers of the Gentlemen Adventurers. Not so with colonization. "In event of settlement, colonization is at all times unfavorable to the fur trade," runs a minute in the record of a Company meeting in 1811. But the colonists were bound to come, no matter how bitter and dogged the opposition of the Hudson's Bay Company. In Manitoba, in California, in Oregon, feudalism had slowly to retreat as democracy in the person of the colonist and his family advanced. Miss Laut gives the story in full of Lord Selkirk's capture of the Company thru buying up shares during a period of depression in order that he might carry out his plan of forming a settlement in what is now Manitoba. When it comes to the settlement itself she stops short and leaves the further history to others. Similarly with the settlement of Oregon, and the great boundary dispute which was settled by the Treaty of 1846. Miss Laut is evidently of the opinion that England gave away what had been won by the Hudson's Bay Company, and what therefore Great Britain had a right to keep. Still, she acknowledges that in the contest between feudalism and democracy it was best that democracy should win, that the home of the settler was worth more than the trading post of the fur dealer, and that American settlement of Oregon had become an accomplished fact before Commander Gordon, Lieutenant William Peel and Lieutenant Parke came out to see whether, in their feeble and puerile opinions, Oregon was worth keeping by Great Britain. As soon, however, as the colonists arrive Miss Laut retreats. "The record of a colony is not a part of the history of the

^{*}THE CONQUEST OF THE GREAT NORTHWEST. Being the Story of the Adventures of England, known as The Hudson's Bay Company. New Pages in the History of the Canadian Northwest and Western States. By Agnes C. Laut. Two volumes. New York: The Outing Publishing Company. Pp. xxi+409, ix+415. \$3.

English Adventurers," is her concluding word in regard to Manitoba, Oregon and Vancouver, as soon as the fur trader is replaced by the home maker, and the story of the Hudson's Bay Company in the Far West ends with the noble kindness of John McLoughlin to the poverty-stricken American immigrants whose coming was to mark the end of his dream of western empire.

Henrik Ibsen. The Man and His Plays.

By Montrose J. Moses. New York: Mitchell Kennerley. \$1.50.

The Players' Ibsen. The Doll's House.

Little Eyolf. Newly Translated from the Dano-Norwegian text. Edited by Henry E. Mencken. Boston: John W. Luce Company. 75 cents each.

The volume of Ibsen literature had reached immense proportions before his death, but since it has been swelled by many contributions in the way of correspondence and personal reminiscence, some of which have thrown a new light on his character and methods of work. For that reason such an up-to-date and comprehensive book as Mr. Moses has given us is especially welcome. He has conscientiously gone thru a very large proportion of what has been written about Ibsen, including the numerous magazine and newspaper articles, which are ordinarily overlooked, and he has subjected each play in turn to a careful analysis. He does not confine his attention to the social dramas, but gives more space than usual to the earlier historical plays and "Emperor and Galilean." Another unusual feature of the volume is the references to the stage production of the dramas in this country and abroad. There is, in fact, no other book of its size in English that contains so much information about Ibsen as this.—The new translation of Ibsen now appearing in *The Players'* edition, differs very little from the familiar Archer version, and does not seem to be any improvement, so far as the English is concerned. Nor do we find the introductions, by Mr. Mencken, the biographer of Nietzsche, superior to Mr. Archer's, but it is a handy little edition and the notes are interesting. Here for example, is the alternative "happy ending" which Ibsen conceived to write for the "Doll's House" when it was produced in Ham-

burg, as a substitute for the slamming door. Beginning after Nora's "Good-bye," it reads:

Torvald. Well, then—go! (Grabs her by the arm.) But first you must take a last look at your children.

Nora. Let me go! I don't want to see them! I can't!

Torvald. (Draws her toward the door at the left.) You *must* see them! (Opens the door and says softly) Look; there they sleep, so quiet and care-free! Tomorrow morning, when they awake and call for their mother, they'll be—motherless!

Nora (Quickly.) Motherless!

Torvald. As you were.

Nora. Motherless! (An inward struggle. She lets her traveling bag fall and says) Oh, I am doing myself a wrong, but I can't leave them! (Sinks down before the door.)

Torvald. (Ecstatically, but softly.) Nora!

The Government of American Cities: A Program of Democracy.

By Horace E. Deming. New York: G. P. Putnam's Sons. \$1.50.

Mr. Deming's dicta as to our city government, so that there shall be greater response to the demands of the people and the needs of the city, are summed up by him as follows:

"A city should be a local government clothed with ample power to satisfy all the local needs of the community within its corporate limits. It cannot be such a government unless it can decide all questions of purely local policy for itself and organize its own methods for enforcing the policy. The framework of the government of a city should be the one which its citizens find best suited to the peculiarities of their own local conditions and circumstances, but it should be simple, centering authority and responsibility in a few elected officials, and the election of these officials should be separated by a considerable interval, preferably a year, from all other elections to public office."

Mr. Deming dwells upon the struggles of our American cities to free themselves from the domination of the State legislatures, and writes hopefully of the growing strength of the cities in wresting power from the legislatures. He refers to the fact that Chicago's form of government could not be interfered with by the State Legislature as a determining factor in the change of personnel of the City Council. The city had either to submit to bad government or to raise the character of its local legislators. It chose to do the latter. Public opinion, "that obtained local government from the State Legislature of Iowa by general law, and reduced to a mere formality the

constitutional provisions requiring the submission of a home-made charter to the Legislature of California for ratification," will, according to Mr. Deming's view, bring about the changes which he advocates. He submits them in the form of a municipal program, which has been adopted by the National Municipal League.

The New International Yearbook, 1908.

Edited by Frank Moore Colby and Allen Leon Churchill. New York: Dodd-Mead & Co. \$5.

A few years ago we called attention editorially to the fact that there was no satisfactory annual compendium of statistics, history and literary and scientific progress published in the United States. The only things of the kind we had were the newspaper almanacs, which were very handy but altogether inadequate. Now, however, the *International Yearbook* is reviving and the second volume in the new series is published. It is similar in size and style with the new "International Encyclopedia" and is adapted for bringing this or any other encyclopedia up to date, but it is also a useful volume for any library because it covers the gap between the current magazines and the reference books; the period on which one most often needs accurate information and knowledge and on which it is hardest to get. The volume contains biographies of men who have become prominent of late; statistics of various countries, cities and institutions, and reviews of literature in English and other languages; an account of political and sociological events and a report of recent progress in the various sciences. The volume contains nearly 800 pages, about fifty full page illustrations and eight maps.

The Commercial Products of India. Being

an Abridgment of "The Dictionary of the Economic Products of India." By Sir George Watt, C. I. E., M. B., C. M., LL.D., F. L. S. New York: E. P. Dutton & Co. Pp. viii, 1,189. \$5.00.

As a book of reference, Sir George Watt's *Commercial Products of India* ought to be within handy reach of every student of economic and political conditions in Great Britain's Eastern empire. In fact, it is not unreasonable to assert

that a study of this encyclopedia of the natural products of the country would give a better understanding of social conditions, of the wealth and poverty of India, and of the political unrest of the natives, than could be gained by an exhaustive study of the history and government of the country unaccompanied by a knowledge of the products that must form the basis of its civilization. Sir George Watt does not concern himself with the human and political aspects of his subject. He does not go into the methods pursued in Indian agriculture, nor yet into any questions of land tenure, or of large and small proprietors. He confines himself to a description of every product of the soil in India—animal or vegetable—which is an object of commerce. These are arranged in alphabetical order, usually under their scientific names, the popular names being, however, well indexed at the end of the volume. Under each heading Sir George Watt gives a description of the plant or animal, its varieties, an account of its habitat, its uses, substitutes which may be used as alternatives, and a history of its growth both in India and in other parts of the world.

The Fate of Iciodorum. By David Starr

Jordan, President of Leland Stanford University. New York: Henry Holt & Co. 90 cents.

This clever satire on the policy of protection makes a timely reappearance now that Congress is engaged in a bungling pretense of tariff reduction. Those who have no patience for long statistical arguments will enjoy reading how the French town tried to increase its prosperity at the expense of its neighbors by putting an octroi on boots, and how that led inevitably to extending the protection to other local industries, until everything had to pay at the gate, and how the factories flourished and the people flocked in, and prices rose, and everything prospered except that more of the people had to go barefoot every year, and mysterious stoppages of business occurred with alarming frequency. But it all turned out to be a nightmare. No such state of affairs exists; at least not in Iciodorum.

Literary Notes

....In Dutton's announcement of new books published last week the title of the third volume of Fletcher's *Introductory History of England* should have been included. It covers the period from the Restoration to the beginning of the Great War, 1660-1792.

....One of the most significant and influential religious books of recent years is the Abbé Loisy's *The Gospel and the Church*. A new edition is issued, with an introduction by Nev. Newman Smyth, D. D., whose *Passing Protestantism and Coming Catholicism* revealed his firm grasp of the entire Modernist movement. The new edition is also from the press of Scribner's (1.00 net).

....A newer edition of Rev. Alexander Maclaren's practical and devotional *Expositions of Holy Scripture*, to be completed in thirty volumes (New York: A. C. Armstrong & Son), deals with the Psalms, Luke, Romans and Ezekiel to Malachi. These expositions follow a method of pulpit treatment of Biblical passages that is fast passing, at least in America. One can scarcely believe that a congregation in these times would long be patient under such homilies.

....Miss Margaret A. Currie has done exceedingly well in selecting and translating 500 of *The Letters of Martin Luther* (The Macmillan Co.). A hundred years ago Coleridge wrote: "I can scarcely conceive a more delightful volume than might be made from Luther's letters, especially those from the Wartburg, if translated in the simple, idiomatic, hearty mother tongue of the original." This translation bears out that judgment. Few men who have served the world are better worth knowing intimately than the great German reformer, and these letters reveal him as he was. The volume is worthy a place beside the great biographies of the world's master spirits.

....Ex-President Eliot, of Harvard, has partially fulfilled his promise of selecting a set of "best books" sufficient to fill a five-foot shelf. He said: "It is my belief that the faithful and considerate reading of these books, with such rereadings and memorizings as individual taste may prescribe, will give any man the essentials of a liberal education, even if he can devote to them but fifteen minutes a day." The selections as far as have been made follow. It is necessary to explain that several titles are supposed to be bound into one volume: "Autobiography of Benjamin Franklin"; "Journal of John Woolman"; "Fruits of Solitude," by William Penn; Bacon's "Essays" and "New Atlantis"; Milton's "Areopagitica" and "Tractate on Education"; Sir Thomas Browne's "Religio Medici"; Plato's "Apology," "Phædo" and "Crito"; "Golden Sayings" of Epictetus; "Meditations of Marcus Aurelius"; Emerson's "Essays"; Emerson's "English Traits"; complete poems of Milton, Johnson's "Volpone"; Beaumont and Fletcher's "The Maid's Tragedy"; Webster's "Duchess of Malfy"; Middleton's "The Changeling"; Dryden's "All for Love"; Shelley's "Cenci"; Browning's "Blot

on the 'Scutcheon'; Tennyson's "Becket"; Goethe's "Faust"; Marlowe's "Dr. Faustus"; Adam Smith's "Wealth of Nations"; "Letters of Cicero and Pliny"; Bunyan's "Pilgrim's Progress"; Burns's "Tam O'Shanter"; Walton's "Complete Angler" and "Lives of Donne and Herbert"; "Autobiography of St. Augustine"; Plutarch's "Lives"; Dryden's "Æneid"; "Canterbury Tales"; "Imitation of Christ," by Thomas à Kempis; Dante's "Divine Comedy"; Darwin's "Origin of Species"; "Arabian Nights."

Pebbles

FORTUNATELY the Navy Department order removing figureheads applies to ships, not to officers.—*New York Evening Post*.

"It is the will of Allah!" exclaims the ex-Sultan. We believe it—but it took a long time to get it probated.—*Cleveland Leader*.

BEATRICE, THE BASHFUL BISCUIT BUILDER.

Beatrice had been raised in the Yeast, where her humble parents had striven to have her bread as well as they could. But it did not pan out, and she, poor girl, had taken the little dough she possessed and come to Baker's Biscuit Factory to learn the wheys of the trade. Here she met Oswald, knee-deep in the flour of his manhood.

"Be my wife," he cried, "for I knead you badly."

"Nay, nay," she answered, "I shall marry the manager and rise into the upper crust."

And with this crumb of comfort, Oswald must kneads be content.—*Columbia Jester*.

O WHERE is my wandering ma tonight?

O where can my mother be?

She hied her forth to the Suffrage fight

And hasn't come home to tea.

The range is cold on the kitchen trail,

The cupboard is bleak and bare,

For mother has gone to the county jail

For pulling the Speaker's hair!

O where is my wandering ma tonight?

My mother, oh where is she?

She dwells in the "box,"

While father's socks

Are holey as they can be!

—*Harpur's Weekly*.

THE PEDESTRIAN IN 1900

Chug-Chug.

Br-r--! br-r-r!

Honk-honk!

Gilligillug-gilligillug!

The pedestrian paused at the intersection of two busy cross streets.

He looked about. An automobile was rushing at him from one direction, a motor-cycle from another; an auto-truck was coming from behind, and a taxicab was speedily approaching.

Zip-zip! Zing-glug!

He looked up and saw directly above him a runaway airship in rapid descent.

There was but one chance. He was standing upon a manhole cover. Quickly seizing it he lifted the lid and jumped into the hole just in time to be run over by a subway train.—*Cleveland Plain Dealer*.

The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, \$2.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, \$1.75 a year extra; to Canada, \$1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with \$1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

A Tax on Net Earnings

THE Treasury deficit for the fiscal year now nearly ended is about \$100,000,000. It is admitted that the tariff bill soon to be passed will not yield enough revenue to supply the Government's wants. In the House an inheritance tax was added. This tax the Senate will not accept, mainly for the reason that inheritance taxes are now imposed by more than thirty States which Senators represent. It was believed a few days ago that a majority of the Senate had been secured for the passage of an income tax bill. Mr. Taft's message opposing the enactment of such a bill at this time, and recommending a tax upon the net incomes of corporations and joint stock companies, is said to have reduced that majority to a minority. It is now expected that the proposed tax on net earnings will be levied, and that Congress will adopt a resolution for an income tax amendment to the Constitution.

Revenue to meet the large and continuing deficit is needed now, and will be needed, in all probability, for two years to come. It cannot be obtained promptly by an income tax law, for if such a law should be enacted it would surely be taken to the courts, where a final deci-

sion would not be reached in less than two years. And by that decision the law might be annulled. The resolution for an amendment, however, ought to be adopted, for, as Mr. Taft says, the national Government ought to have power to levy and collect an income tax. We regret that it does not clearly have that power now.

But would the proposed tax on net earnings yield the desired revenue promptly? It seems to us that such a law would also surely become the subject of litigation, and that for this reason there might be delay. Such a tax cannot stand unless it is shown to be an excise tax. In the case of the Spreckels Company, mentioned in the President's message, Justice Harlan remarked, in the Supreme Court's opinion, that "the distinctions between taxes that are direct and those which are to be regarded simply as excises are often very difficult to be expressed in words." The question now is not, however, whether such a tax would eventually be sustained, but whether there might not be as much delay as would take place if an income tax should now be passed.

Undoubtedly, the passage, and afterward the enforcement, of such a law will be opposed by corporate power. Objection is made because of the inquisitorial methods which must accompany the enforcement of it, because of the inevitable publicity given to the profits and affairs of companies. We may expect opposition from corporations enjoying excessive protection from tariff duties, because disclosure of their profits would stimulate a popular demand for a reduction of the tariff rates. It is difficult to believe that Mr. Aldrich would like to see such a tax imposed and collected. State influence, also, will be exerted in opposition, as in the case of the proposed inheritance tax, for the corporations are subjected to State taxation, and it will be asserted that the tax province of the States has been invaded. And it will be said that if the privilege of doing business under the corporate form is to be taxed, this privilege is granted by the States.

If a large sum of additional revenue is needed now and will be needed for one or two years to come, and if power to levy an income tax is to be obtained by

amendment within two years, these are some of the reasons why special taxes of another character, taxes surely available for temporary use, should be considered. For example, the stamp taxes, which yielded \$43,000,000 in 1899, and \$41,000,000 in 1900. These taxes would be easily enforced and collected, while the proposed tax on net earnings would require a costly force of agents to examine accounts and other records. It is not proposed that any corporation or joint stock company shall be exempt.

It is to be said in behalf of the tax on net income, however, that it would, if sustained by the courts, enable the national Government incidentally to exercise that power over corporations which President Taft—and his predecessor—regards as essential to the Federal supervision of such organizations. This is a consideration of much importance. It may be that supervisory control can be acquired in no other way. The tax, however, is not an ideally just one. We cannot see that it could touch the fund set apart for interest on bonds, and for this reason, as certain Senators point out, it would not fall upon great individual fortunes invested mainly in bonds. Moreover, it would tend to increase issues of bonds and reduce issues of stock.

It may be noted that in the search for additional revenue, neither the President nor the Senate's Finance Committee has considered the revenue possibilities of tariff revision. Both appear to hold that the limit there has been reached. A reduction of many duties which are actually or virtually prohibitory would increase the revenue, altho it would decrease the profits taken from the people by manufacturers who have combined to suppress domestic competition under the shelter of these prohibitory rates. The revenue would be enlarged by a readjustment of the tariff in accordance with the requirements of the national Republican platform.

Charter of Brown University

THE charter of Brown University was given in 1764, in old Colonial days. The university has been rather proud to keep and live and grow under this ancient charter; but now it has become quite too antiquated. Even the finest old Colonial

houses and furniture have to be reconstructed.

It was a very liberal charter for those days, as might be expected since it was the charter for a Baptist college in Rhode Island, and the Baptists, having to fight for their own liberty, were under bonds to defend breadth and charity. Accordingly they provided, while assuring that it should remain a Baptist college, that the other existing denominations should have rights in it. The provision of the charter that assured this generosity reads as follows:

"That the number of the Trustees shall and may be thirty-six; of which twenty-two shall forever be elected of the denomination called Baptists, or Antipædobaptists; five shall forever be elected of the denomination called Friends, or Quakers; four shall forever be elected of the denomination called Congregationalists; and five shall forever be elected of the denomination called Episcopalians; and that the succession of this branch [Trustees] shall be forever chosen and filled up from the respective denominations in this proportion, and according to these numbers, which are hereby fixt, and shall remain to perpetuity immutably the same. . . . And that the number of the Fellows (inclusive of the president, who shall always be a Fellow) shall and may be twelve; of which eight shall be forever elected from the denomination called Baptists, or Antipædobaptists; and the rest indifferently of any or all denominations."

That, we say, was a very liberal and generous provision for those days, but it is quite out of keeping for these days. It included all the denominations that they had, but there are others now. The Methodists have come up since then, and not the most worthy Methodist can be elected trustee unless by the device of calling Methodists Episcopalians. Equally, the best Unitarian cannot be elected except by pretending that he is a Congregationalist. Further, the day has passed for tying a great college or university to any single denomination. The denomination does not need or want that protection. It makes the college narrow, limits its friends, gives occasion for constant misunderstanding. Brown University does not want to be managed in the interests of Baptists, but of all the people of the State and the country.

There has been some effort for years to amend the charter so as to remove all denominational limitations, and the establishment of the Carnegie Foundation has

brought this movement to a head. Who would have thought that this Foundation, whose purpose was simply to provide pensions for retired college teachers, would have wonderfully elevated the standards of colleges over the whole country? But that result was involved; for the question had to be settled, What is a college? And those which fall below the standard in endowment or instruction had to be rejected until they raised their standard. From the grants denominational colleges were excluded; and so charters were carefully examined to see if they put the colleges under denominational control. It was plain that Brown University is distinctly denominational by its charter, so that its professors are excluded from the pensions.

The trustees frankly admit that they want their professors to have the same advantages as those of Harvard or Yale, and they have issued a report to this effect, explaining the need of a change of charter, and presenting the case to the friends of the university. They do not instantly go to the Legislature, but they wisely ask first the support of their constituency. We cannot doubt that it will be given. Brown wants to be broad; and yet, without charter restrictions, its history and its support will naturally ally it to the Baptists. The majority of the trustees will naturally remain Baptists, but the institution will not be Baptist. Is Columbia University Episcopalian, or Yale Congregational, or Princeton Presbyterian? They are national institutions, and Brown should have equal liberty and yet remain no less Christian. We do not make so much of our denominations as we did.

Mid June

JUNE is the month of roses. It opened with the last of the lilacs lingering in the hedgerows. We go out for big bunches of mock orange, and are glad that the world is so full of fragrance. White clover paves the barren spaces, and bees are gathering from it some of their richest treasures. Did you ever notice how quiet the bees work in clover? It is a nice piece of business. Common honey does not need so much study; and in the

basswoods the bees work like so many roysterers.

The first rose to open is greeted like a friend that returns from a long absence. The next day there are four or five; and then there are aprons full. The beauty of the rose, that of a single rose, is not the glory of it, but the profusion. The whole Rosaceæ family has this heartiness. It tumbles its beautiful petals down from the apple trees, and shakes showers of them out of the cherries and plums. When a rose bush is really in bloom you hardly know which may be picked. A big bunch of apple blossoms snapped from the bough seems like robbery.

Catbirds have hatched their first nestfuls, but the young robins are already flying. The atmosphere is full of love and love songs. They have all had their domestic spats, and some curtain lectures have been delivered in the bushes; but, bless you, there is nothing that so completely fills the world with music as a baby—and there are four of them in that thorn bush, and everywhere else, all about us, they are hatched or hatching; a hundred nests full of hope and song. It is an anxious time and a busy one, for the mouths to fill are multiplied by three or four. Saw you ever a finer cradle than that of the oriole that swings on the low bough of that Greening tree?

There are only two fruits that are red and ripe in June, the strawberry and the cherry; but they are enough for one month. Both are beautiful and both are good. What a procession it is, down thru the gardens of raspberries and dewberries and blackberries, and thru the fields of huckleberries, and thru the plum yard, and the orchard of pears and apples, until we shut our cellars filled full in November. Our fathers were satisfied with half of these things. It is a curious fact that abundance only makes us long for more, and so the world is kept on the road of betterment and Burbanks.

The farmer has been cutting his early hay, and he has it all in his barn by the middle of the month. The cows are in the flush of their full milk. You see them lying about the valley pastures, wherever you look. They are lazy just now, and

look it in every outline and movement. They have nothing to do but to eat the lush pasture; and all they want is spread out before them. A good deal of it is under foot, and being ground into soil. Digestion is happily an unconscious job, and milk-making is something that the cow learned away back before cows were cows. Flies have not yet hatched to any extent, but by and by the cow will not lie down so much at ease and peace. The farmer rests his horses in the meadow, and takes a quiet look over the valley. He, too, has his heredity, for our generation does not swing the scythe, indeed it does not know how to do it. The fine art of farming is to do the most with the least outlay of labor. But drive on, my farmer friend, there is no romance in your machine, and no music in the clatter of the knives. Only the curing grass is just as sweet as ever, and nothing on earth is so deliciously wholesome as making hay.

The brooks are still full, but they are no longer noisy; and along the banks the daisies are blossoming, and the wild roses are looking at themselves in the quiet pools. Everybody in the country should have a brook, and everybody should keep one wild corner, where he lets Nature have her own way about everything. Nature likes a lot of things that other folks root up. She likes elderberries, and sumacs; and down in the cool spots she is sure to have ferns and forget-me-nots. Where she has room for it she will make an arbor of wild grapes and wild sloes; whom for? why for anybody or anything that happens to come along. Nature cares for cows and squirrels as much as she does for men. The water is in no such hurry as it was when May came in, and it gurgles around the big roots of the water maples, and moves lazily, if at all, where the ferns grow.

It is vacation time, and the cities are full of boys and girls that ought to know summer under the apple trees, and to get acquainted with the lindens; ought, indeed, to understand Nature when she is at work in the woods and the fields. What shall we do about it? The young folk are surely growing toward industrialism. If we could only open the door into the country as the schoolhouses are

closed, it would be the making of our young folk. The chief trouble that our farmers have had with the lower class of laborers is that they cannot be trusted. There is necessarily a larger degree of familiarity between the farmer and his help than is found in city employment. The class that needs to get out is the well-to-do, and these the farmer will gladly accept. Our school boys and girls can afford to go at low wages, or no wages at all.

From July 1 to September 1 there is not less than half a million of these city youngsters that should have country homes—places where they can learn to work, learn to think, and learn to use their senses. They will come home fascinated with the art and science of land culture, and their faces will thenceforth be toward the army of producers rather than consumers. Find a good country home where your boy can go to work as if it were a school; where he can find out things and ways of doing things. Above all send your girl. The future motherhood of America depends on more of this sort of schooling. We are glad to know that this bringing together of the city and the country is becoming more possible and is being put in practice.

June glorifies work; it has every tool busy; every leaf growing; every rootlet feeding its root and every root feeding its tree. If anything anywhere idles for a moment, it is caught up at once, and worked over into something else. "My Father worketh hitherto, and I work." This is the law of the universe. "Who knows the world? It is he, the worker. He is in sympathy with the Creator." Yes, June believes in work; it honors the worker—there is nothing noble but achievement.

Municipal Profit and Loss

THE movement for better municipal accounting, and a fuller publicity in all municipal affairs, which is a part of the larger movement of municipal reform in American cities generally, has begun none too soon. An analysis of the finances of a hundred and forty-eight cities of the United States having over 30,000 inhabitants each, recently made

for the American Society of Municipal Improvements, by J. W. Howard, C. E., chairman of the Committee on Municipal Data and Statistics, is a thought-provoking document. The facts are drawn from United States census bulletins published within the last five years, and the conclusions are kept close to the arithmetic.

From 1902 until 1907, inclusive, the total revenues of the one hundred and forty-eight cities, not including borrowings, rose from \$328,509,429 to \$420,637,500. The tax per capita rose from 16.10 in 1902 to 17.98 in 1907. The general property tax rose from 13.08 in 1902 to 14.07 in 1907. All the other taxes, including special property taxes, poll tax, alcohol tax, alcohol selling license tax, permits, and so on, increased slightly. The total per capita tax increase of \$1.88 in five years was equivalent to a per capita increase of 17 cents per year.

The total expenditures increased from \$272,616,313 in 1902 to \$343,711,052 in 1907. The per capita increase was from \$13.36 in 1902 to \$14.90 in 1907, a rate of increase of 30 cents per inhabitant per year for five years. The expenditures covered in this outlay do not include outlays for permanent improvements and reduction of debt. Expenses of general administration, including expenses of mayors and aldermen, have been decreasing, while the police, correction and charities departments are costing more year by year. Sanitation and schools are costing more—a wise increase. Streets and paving are costing at the present time less than they should, the work generally being unsubstantial and inadequate; a mere handing on of an increasing burden to the future. Abundant experience has shown that it is good economy to do paving and other street work thoroly.

The chief item of increasing expense is, as we were prepared to expect, that for the fire departments. American wastefulness is nowhere more conspicuously manifested than in our enormous annual loss by fire. The fire department figures of municipal expenditure confirm the conclusions long since drawn from fire insurance statistics. American cities

are badly and wastefully constructed. It has been demonstrated that an enormous saving could be effected by putting into fireproof construction a large part of the money now paid for insurance premiums and fire department service. Yet, in the face of the irrefutable facts, we find builders and owners persistently fighting every legislative and administrative attempt to secure substantial construction. It would be hard to find a more remarkable proof that the American business man is by no means always the hard-headed specimen that he likes to pose as being. A good many examples of him are extraordinary freaks of stupidity.

The noticeable omission in the data is that of revenues from public service corporations and public services maintained by municipalities. The statistics in these sources are not yet obtainable, for the reason, as it is almost superfluous to remark, that public service corporations are not eager to have the niggardliness of their contribution to the public revenue—in exchange for the privileges that have been granted to them—made a public exhibit. This omission should be remedied. When the facts are made known, the determination of the public to make the great beneficiaries do a little more “for their country” than they have been in the habit of doing thus far will not be weakened; and the way to solve one of the great problems of the time will be seen to be a little clearer than it has looked until now.

The problem is, How, in the face of a steadily increasing pressure upon municipalities to provide such necessary benefits as more and better schools, playgrounds and parks, and improved sanitation, and the steadily increasing rate of taxation on personal property, can we check the alarming increase of municipal indebtedness, which already exceeds the national debt? The immediate step toward finding an answer to this question is to ascertain first the revenues of the public service corporations, and secondly their contribution to the public revenue. The deeds which these two statistical items would bring into the daylight have enjoyed the cover of darkness long enough.

Heretics Abroad

THE heretics have won the day in Chicago and New York. The Chicago Baptist Ministers' Meeting refused to adopt the resolution asking Prof. George B. Foster to withdraw from the Baptist ministry because of views expressed in his book, "The Function of Religion"; and the Presbytery of New York admitted to ordination the three students of Union Seminary charged with denying the ancient faith. It has been a bad week for the old guard, and these occurrences give evidence of a mighty change of view on questions of theology within the past twenty years, or even ten. It is worth while to consider what it means.

The principle defended is that of liberty, and the question is that of the extent of it. As we showed last week the Presbyterian General Assembly has declared that there is no formulated "system of doctrine," written in words, on which its Church must stand. This is equivalent to admitting that each generation and each year must create its own standard of faith. The heretics of one year may be the orthodox of the next. The Chicago Baptists are satisfied to make only general statements of their position, and they refuse the definite formulations asked for. They say:

"Resolved, That we as members of the Baptist Conference, believing in the historic Baptist position of liberty of thought and utterance, reaffirm our past position of belief in the deity of Jesus Christ and salvation by faith in Him, and that we will continue to preach the Gospel of Jesus Christ as God gives us to understand it. And that we repudiate any attitude to the contrary, whether preached by Professor Foster or any other."

And this is all they say. Professor Foster is not put out.

Nevertheless it is only fair to recognize the mighty breadth of tolerance which these Baptist and Presbyterian bodies thus allow. It is hardly less than revolutionary.

It began with the scientific and historical study of the Bible. When we found that the world was more than six thousand years old, that there was no universal flood four thousand years ago, that Adam was not made directly from dust and Eve from his rib and that the Tower of Babel was not the occasion of

the diversification of languages, we had gone too far to stop. The process of criticism had to go on from Genesis to Revelation, with no fear of the curse at the end of the last chapter. It could not stop with Moses and Isaiah; it had to include Matthew and John and Paul. Every one of them had to be sifted; they had already ceased to be taken as unquestioned, final authorities, for plenary inspiration had followed verbal inspiration just as soon as the first chapter of Genesis had ceased to be taken as true history. The miracles of Jesus had to be tested as well as those of Elijah. The date and purpose of the Gospel of John had to be investigated historically as well as that of the Prophecy of Isaiah; and the conclusion of historical criticism had to be accepted with no regard to the old theologies. We have just reached this condition, and there is repeated evidence that it makes an epoch, a revolution, in theological thought. This is what we learn from Chicago and New York, from two such militant denominations as the Baptist and the Presbyterian.

Consider what it means. In England Professor Forsyth is repeating with emphatic insistence that Christianity centers not in the teachings but in the person of Christ, the Christ of the Trinity, miraculously conceived, risen from the dead, ascended up into Heaven and there seated as one of the three Persons in the Trinity of God. But the current critical theology, which we read in the current Bible dictionaries and which is taught in venerable theological seminaries, doubts or denies all this. To this present teaching, which has invaded all our denominations, Jesus is the world's prime teacher, but it can assert nothing more. There is, it declares, no reasonable proof of his birth from a Virgin, no certainty of a physical resurrection; the Gospels must be analyzed, for they contain mythical elements, non-historical miracles, unverified accretions. The Synoptic Gospels give us more correctly the oral teachings of Jesus, but the Gospel of John and the Epistles of Paul make the person of Jesus central and represent a stratum added to the genuine simpler teachings of the Master, and must be analyzed and questioned or rejected.

But this doubt, even this questioning or denial, changes the old evangelistic theology. It questions or denies the Trinity, the Resurrection, the Sacrifice of the Cross, even all miracles, and it undermines all authority of inspiration or even revelation, and sends us back to human reason, with such divine guidance as may be allowed; the authority of the Bible and the authority of the Church both to be validated only by human reason. Just how this differs from the old Unitarianism, and what need there is for Unitarianism to maintain itself, are questions that must arise for consideration.

Well, what is left? The teachings of Jesus in the three Gospels are left, the Fatherhood of God, and what constituted the bulk of Jesus's teaching, namely the supremacy of the spiritual, the genuine religion of the heart as against any shred of all the formalities of religion; the rule of self-sacrificing love as something vastly more than bare justice or righteousness. In fact it leaves us the plain obligations of nearly all the Bible, but it leaves out as uncertain or less important certain doctrinal statements found also in the Bible, or, at least, deduced from it and made much of in theology. One may go thru the whole Old Testament and find no condition of salvation that is not involved in character, to do justly, to love mercy, and to walk humbly before God. The bulk of the New Testament means the same thing, with its insistence on repentance for sin, and love the fulfilling of the law. But after our Lord's death emphasis was put on believing in him; but it would be an error to regard this as annulling or even limiting the conditions elsewhere generally given. He that tried to follow Christ sufficiently believed in him. Indeed, to sorrow for wrong done, to seek a better life and a Christly character is all that we can do. How and why our Heavenly Father can accept us, and what the Son or the Holy Spirit do for us, belong to God and not to us. The most ignorant man who loves and tries to obey his Father in Heaven and is ready to sacrifice himself in love for his neighbor, is as true a Christian as Augustine or Calvin or Wesley. Since the previous page went to press the Chicago Baptist Ministers' Conference has dropped Prof. Foster from membership.

The Jubilee of Belgium's Clericals

IN this month of June twenty-five years ago, the Clericals came into power in Belgium. They had, however, only a majority of 32, due mainly to the curious system of plural voting in vogue in that tight little kingdom. Three years ago, that is 1906, the majority was reduced to 12, altho the votes stood 1,153,000 Clerical as against 1,173,000 non-Clerical. The plural voting still kept them in power. The chances are, however, that the coming elections of 1910 will bring them defeat.

It cannot be denied that the Clerical party have shown great strength and much fair ability. In some ways their success is owing to the splits among their opponents, of whom some favor and others reject universal suffrage. Again Liberals and Socialists fought one another while usually uniting against the dominant Clerics. On their side, the Clericals stood in with royalty, denying or defending King Leopold's atrocities in the Kongo. In this they had the help of the ruling powers of the Church from the Pope to Cardinal Gibbons, who wrote a letter to the Peace Congress in session at Boston in defense of His Majesty's government of the Kongo Free State; as also to that American bishop, thru whose good offices Thomas F. Ryan lifted off Leopold's shoulders the African rubber output—the main cause of those dreadful barbarities, that have amazed the civilized world. Again the Clericals passed a number of laws which benefit the workmen, who enjoy them and keep on becoming more and more socialistic.

But the main stress of the Belgian Clericals was given to the school question. The liberal ministry of Frere-Orban, which went under in 1884, had enacted a law creating in every commune the public school, that is, primary and non-sectarian, whose teachers should be graduates of the State normal schools. The attacks of the clergy on those schools embroiled Belgium with the Church. In self-defense Frere-Orban published in three or four portly volumes all the correspondence, telegrams, letters, nuncio's reports, episcopal pastorals, etc., etc. The Belgian hierarchy cut a sorry figure, when this publication came

out. The row was too much for the Liberals, who went out of office in consequence.

Once the Clericals were in control they reversed the educational policy. The very first year laws were passed establishing the so-called "free school." Within a year—by 1885—of 2,000 *public* schools, nearly 900 had disappeared, while 1,500 *free* schools were opened—all taught by the religious orders. Ten years later, the then President of the Council, Schollaert, had a law passed authorizing the free schools, even those not recognized by the communes, to receive State aid. The clergy thus had access to the public funds even in communes where the majority of the municipal council, as also of the voters, were anti-Clerical. Lastly the leader, Woeste, went a step further. He authorized the State to close the normal schools, thus ignoring the rights of cities, like Brussels, and of provinces, like Hainaut. But 1910 may see their downfall.

The story of Belgium's schools during the past twenty-five years is an objective lesson that will hardly be lost upon thoughtful men the world over.

✽

Chin Gee Hee

The papers are full of the murder of a young woman by a Chinese. Every day there are murders by Americans. We wish to tell of another Chinese, one Chin Gee Hee, a merchant of Seattle. He is one of the Chinese merchants who settled in Seattle many years ago. It is they that have built up the trade with the Orient on which Seattle has so much depended. They were the first importers, the first jobbers in foreign goods. They made the first market for American flour in China and have been the most important factors in building up the trade of the city. This Chin Gee Hee has returned to China, being asked to take over the construction of the first piece of railroad work ever undertaken in China without the aid of Europeans or Americans. He has just completed the work, and been decorated by the Emperor. Observe that it was his training in this country that gave him the ability to do it, and in its construction Seattle was the favored market for the purchase

of all supplies which could be obtained abroad, including a considerable share of the rolling stock. And these are the men whom so many of our blindest citizens would wish to exclude from residence or citizenship.

✽

City Rule by Commission

What has been called The Galveston Experiment, that is of governing cities by responsible commissions, has spread among our cities, and is working well wherever it has been tested. In the Northwest it is called the Des Moines Plan. This city was handicapped by a growing debt of two hundred thousand dollars, but now, after two years' trial of the new plan, has twenty thousand dollars in its treasury. Small wastes have been eliminated, more than enough to pay the commissioners' salaries. The city's funds have earned during the last twelve months nearly ten thousand dollars. All cash is now paid into one treasury, and uniform receipts are used. Every department is audited semi-monthly. The streets have been kept in excellent condition, and the rates for lighting have been lowered. Public improvements have gone thru easily, and without a trace of graft. The City Hall is free from politicians, and public affairs are managed on a non-partisan basis. Appointments are removed from ward politicians, and the five commissioners are held strictly responsible for the conduct of all public affairs. Franchise rights are referred back to the people. The opportunity of the people to get a speedy hearing with the man responsible for affairs is the most democratic feature of the whole movement. Good ideas, as soon as they can get one hearing, are very catching; and we look for a rapid expansion of this Des Moines or Galveston experiment.

✽

Miracles of Tongues and Tones

We have seen many accounts of the wonderful experiences of the members of the Pentecostal Mission, who have "received the Spirit," been "sanctified" and "speak with tongues," in San Francisco, Los Angeles, Palestine and China, and in various parts of our Southern States. But the most

wonderful of all we have yet seen is the demonstration which Mrs. Lorena Cotton reports from the Bible Institute, Altamont, S. C.:

"It is wonderful to listen to the sweet music played on the piano, organ, guitar and other instruments; and often by those who know scarcely anything of music, and sometimes nothing at all. It is wonderful to hear the blessed Holy Ghost play at the piano thru Brother Holmes, the president of our school, who doesn't know one note from another. Different ones play different instruments all at once, without any discord. . . . It is clear to my mind it is the great Master of Music, the blessed Holy Ghost, who is doing the playing, and the human is the channel, glory to Jesus!"

Verily a miraculous orchestra by the "sanctified," and we commend it to the students of the wonders and vagaries of religion who conduct their investigations from Worcester and Cambridge. We observe a tone of sadness in their monthly paper, *The Bridegroom's Message*, of Atlanta, Ga., that so few of the foreign missionaries in China have accepted their teaching and received the "power." Prof. Henry Preserved Smith writes us from Meadville, Pa.:

"It might be well in connection with your article on 'Speaking with Tongues' (INDEPENDENT, June 10) to call attention to a paper by Professor Henke in the *American Journal of Theology* for April. From that article it appears that the gift of tongues is much more widespread than many of us have supposed. Occurrences are reported from Norway, Holland, Switzerland, Germany, England, Corea, India, and many parts of the United States. Especially interesting is the account given of the school for girls under the care of the well known Pundita Ramabai. It is reported that tongues of fire appeared here as in the days of the Apostles. It is to be hoped that students of religious psychology will make a careful study of this whole subject."

Church Competition President Taft gave a ten minutes' talk the other day to the Catholic missionary priests at their meeting in Washington. Of course, he spoke of his going to Rome to see the Pope about the Friars' land question in the Philippines, and said it was a proof of the better state of mind at the present time that, while such negotiations fifty years ago "would have sunk any administration," it was taken as a matter of course now. We notice particularly that he told them that he was glad that other

religious bodies are in the Philippines, for a certain amount of competition is a good thing. That they exactly approved this we are not sure, for in the Philippines the coming of competition has not been much welcomed. Yet it would appear that competition has not been bad for the Catholic Church in this country. At the occasion of the banquet on the same day at the American College in Rome, Mgr. Falconio, who is the Apostolic Delegate to this country, proposed the toast to the American Episcopate and declared it to be equal to the best in the world, and that Americans are the Pope's best and most affectionate children. That is true. It is in the countries where there is no competition that the Vatican has most occasion to complain of disaffection and even bitter opposition, and not where the intelligence and character of the members are the highest.

World's Exposition in Berlin

The Germans are beginning to feel it keenly that the world is now regarding them, with their army and growing navy, as the greatest menace to international peace, and are discussing practical ways that would prove to outsiders in a way more effective than words that Germany wants only peace. The idea that is evidently gaining ground is to hold an international exposition in the city of Berlin in the year 1913, as a guarantee to the world of the peaceful intentions of the Fatherland. The influential *Gegenwart*, of Leipsic, thru the well-known Dr. H. Hilger, has become the decided expounder of this scheme, and the political as well as financial phases of the problem are discussed *in extenso*, and optimistically. The most influential journal of South Germany, the Munich *Allgemeine Zeitung*, has come out for the same project and in the interests of the same cause, the chief advocate in this journal being Prof. Dr. Görcke, who is also a member of the Reichstag. Another agitator, in the interests particularly of a better understanding with England, is a visit of some two hundred English Gospel ministers in Germany during June, who come by special invitations and for the purposes of a peace propaganda. On the program was a reception by the Emperor, a visit

to several universities and to the great charitable institutions in Bielefeld. The Hamburg and Bremen lines of steamers carried the visitors from and back to England free of cost. Germany is exceedingly anxious to have the peoples believe in their peaceful intentions.

The following incident is included in the reports sent from Chicago of the attack on Prof. George B. Foster at a meeting of the Chicago Baptist Ministers' Conference for the utterances in his last book, "The Function of Religion," which is being severely criticised. His resignation had been called for. We read:

"Professor Foster declares," cried Rev. Mr. Matthews in the course of his discussion of the recent book penned by Professor Foster, "that one who calls himself a believer in the Bible is a knave. Then, thank heaven, I am a knave."

"May I ask how that word is spelled?" interrupted Professor Parker at this point.

"K-n-a-v-e," replied the speaker.

"If you will pardon the correction," observed Professor Parker, "I have the book in my hand, and the word is spelled 'n-a-i-v-e.'"

We can hardly accept one statement about Dr. Booker T. Washington made by Mr. Walling in his very interesting and important article on "Science and Human Brotherhood." He says:

"Washington does not want the negro to make a special effort now either to obtain the ballot, to extend his higher education, or to demand equal civil rights."

That Dr. Washington should devote his attention chiefly to industrial education is natural, but the fact that he has lately become one of the trustees of Howard University, the highest institution of culture for the negroes, is one proof of his earnest belief that no culture is too high, no education too broad for the exceptional negro who may become a leader of his race.

"They order this matter better in France," said "The Sentimental Traveler," but things have changed since Laurence Sterne, and it is in Germany that they order things better. Last Sunday the opening of the famous Auteuil races was spoiled by a strike of stable-boys which the police could not control. At Leignitz, Germany, the chaplain of the prison struck for a raise in salary, which

the Government had refused. The pastors of the town joined him after making a like demand and meeting a like refusal. The spiritual outlook seemed dark, but the Minister of Public Worship rose to the occasion. He ordered a convict, formerly a teacher and choir-singer, to conduct public worship on Sundays and holidays. Once more the strikebreaker!

This is the one sentence from Lord Rosebery's speech before the Imperial Press Conference which every one is quoting, and which will have vastly more effect than his assertion of the necessity of defense even to the expenditure of the last penny:

"When I see this bursting out of navies everywhere, when I see one country alone asking for twenty-five millions of extra taxation for warlike preparation, when I see the absolutely unprecedented sacrifices which are asked from us on the same ground, I do begin to feel uneasy at the outcome of it all, and wonder where it will stop, or if it is nearly going to bring back Europe into a state of barbarism; or whether it will cause a catastrophe in which the working men of the world will say, 'We will have no more of this madness, this foolery which is grinding us to powder.'"

There is the lesson. It is the working men of the world who will refuse to go to war. *Bellum delendum est.*

With others we accepted as correct the press reports of an address at the General Assembly by Joseph W. Cochran, D. D., secretary of the Presbyterian Board of Education, in condemnation of the State universities, and we commented severely as the case seemed to justify. But we were misled. Dr. Cochran was misreported, and the report he presented to the General Assembly is of a character to prove that he could have used no such language. We much regret that this correction cannot sufficiently repair the wrong done him. It is from his report that we learn that in eight State universities the Presbyterian Church provides either an ordained student pastor, a Church House, a student worker or a lectureship; the Catholic Church, the Methodist, the Episcopalian and the Disciple do as much in six universities, and other denominations follow suit. The time has passed to talk of "godless State universities."

Insurance

Baggage Insurance

THE travel season is close at hand. Tourists, vacationists, pleasure seekers of all sorts and conditions not to mention those who journey for business reasons are going here and there, North, South, East and West. The trains are crowded and the baggage cars are increased in number to provide accommodations for travelers. How many of this great crowd of travelers have been thoughtful enough to insure their baggage? When the steamer "Republic" sank as the result of collision and 400 passengers lost all of their baggage in consequence, the daily papers called attention to the fact that but very few (only about 5 per cent. in point of fact) were indemnified against loss in this regard by means of insurance. We have grown so used to risk loss on personal belongings in the form of luggage or baggage that we do so every time we travel. And yet notwithstanding trains are wrecked, steamers sink, hotels are burned and baggage is otherwise lost we continue to neglect the insurance of our baggage. Why? When you stop to think about it there is no reason that suggests itself that is good and sufficient. Is it not so? Custom and precedence together have heretofore decreed that baggage should be risked and that the owners should take the risk. But that is no reason why this should continue thus. Doubtless 90 per cent. of the traveling public are unaware that they can insure their baggage. But they can and they should. The Insurance Company of North America, whose main office is in Philadelphia, is one concern which makes a specialty of insuring baggage, and there are doubtless others that either do or will do a similar business. The cost is very moderate and it would seem that such a form of insurance would be quite as desirable as is insurance on belongings when they are at home instead of in transit.

LAST week the Mutual Life Insurance Company marked up its contingency re-

serve from \$16,500,000 to \$21,656,886 by order of the New York State Insurance Department. The order in question issued on the ground that the Mutual Life's real estate appeared as an asset as it stood at its book, instead of at its last appraised value. One result of making up the reserve as noted was to bring it \$424,894. about the legal limit based on the new insurance law. Permission was accordingly sought and obtained by the company from the department to maintain this excess until the next distribution of dividends to the company's policyholders, when this sum will enter into the amount of the policyholders' dividend distribution. The difference between the Mutual Life's real estate book value and its last appraised value is \$5,657,049. The value of real estate can only be absolutely fixed by its sale so that differences are bound to arise in any two appraisals involving such magnificent holding totals as does that of the Mutual Life Insurance Company.

PRESIDENT WILLIAM B. JOYCE, of the National Surety Company, in an address before the Minnesota Bankers' Association at Tonka Bay, on June 14, included the following recommendations as tending to decrease defalcations, viz.:

First. Bankers should systematically arrange that employees be required to take vacations.

Second. Employees should frequently be transferred, temporarily at least, from one position to another. Shortages are most frequently discovered when defaulters are absent from their desks by vacations, sickness or when transferred.

Third. Personally verify balances with your correspondents as far as possible.

Fourth. Avoid having receiving tellers balance pass books.

Fifth. Require collection clerks to time-stamp letters accompanying remittances, and invariably supersede them for at least two weeks annually.

Sixth. If any customer has the privilege of depositing late, for instance railroads, etc., require that your system shall prevent an employee taking credit for such deposit without charging his cash therewith.

Seventh. Pay your employees a fair salary for their services. Many defaulters are made by insufficient compensation.

The Report on Exchanges

At the close of a long, painstaking and dispassionate inquiry, the commission appointed by Governor Hughes to investigate speculation and trading in securities and commodities, together with the methods and rules of the Stock Exchange and other similar organizations, has made a strong report which will tend to correct the abuses and evils which it points out, while at the same time it cannot fail to modify the erroneous views of many who have been misled by prejudice and by sensational criticism of Exchange operations. It is noticeable that very little new legislation is recommended, and that this is directed against offenses generally admitted to be of a criminal character, but for which the punishment is not now certain. In what we have said about erroneous views we have had in mind the opinions of many concerning speculation, trading on margin, and what are called "short" sales. This is a commission of high character, including a veteran journalist and recognized authority on finance, an eminent economist who has severely criticised the abuses of recent corporation methods, the very competent Superintendent of Banks in this State, a former Justice of the New York Supreme Court, merchants of high repute and men interested in civic reform. When such a commission points out that speculation may be, and that much of it is, wholly legitimate; that buying securities on a margin is as legitimate as the purchase of any other property when payment in part is deferred, and that "short" selling is not ethically wrong but is an advantage to the community, because it tends to steady prices and to prevent wide and sharp fluctuations, its opinion must have weight, and its arguments will be read with care by those who desire to be well informed and just.

It is a long report, dealing with many details of procedure and recommending many improvements of method, as well as considering the larger topics and principles involved. We can speak here of

only a small part of it. Thorough regulation of the curb market is insisted upon. This is a task for the Stock Exchange, whose members supply 85 per cent. of the curb business. Repeal of the charters of the Mercantile and Metal Exchanges is suggested. We do not see the usefulness of such institutions, where quotations are determined by committees and not by actual transactions. Margins, it is said, should be 20 per cent. Ordinarily they are 10 per cent.; in the cases of wealthy traders they are sometimes nothing. It will be difficult to secure uniformity or an increase, but, undoubtedly, the rate should be 20 per cent. for small transactions by traders of limited means. Legislation is needed for the restraint of those who issue or publish misleading advertisements or prospectuses. These persons have subjected the Exchanges to much undeserved discredit and denunciation. The recommendations for enforcing greater publicity in the affairs of corporations whose stocks are listed must be commended. Publicity with respect to many Exchange operations would cause reform. We cannot agree with all that the commission says about manipulation designed to make a market for new issues. Reference is made here to operations conducted by very powerful interests, and which are successful usually because, so far as the public are concerned, they are carried on under cover. In such cases full publicity would be a corrective. On the whole, however, the report is judicial and sound. The effect of it will be beneficial and it will be regarded hereafter at home and abroad as a memorable contribution to what may be called the literature of Exchange trading.

....The Fidelity Trust Company, of which Samuel S. Conover is president, which began business May 22, 1907, with a capital of \$750,000 and a surplus of the same amount, now has undivided profits of \$186,868.75, deposits of \$5,771,489.61, and total resources of \$7,490,158.09.

For Coughs

Never hesitate to ask your doctor about Ayer's Cherry Pectoral. It is a regular medicine, a strong medicine, a doctor's medicine.

Ayer's Cherry Pectoral

It would be very interesting to know how many years your family physician has prescribed Ayer's Cherry Pectoral for coughs, colds, and all forms of lung troubles. Ask him the next time you see him. We know physicians who have used it for over half a century.
